By practicing again and again you will become an expert to solve all the Salesforce Identity-and-Access-Management-Architect exam questions completely and before the exam time.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q187-Q192):

NEW QUESTION # 187
Universal containers (UC) has a custom, internal-only, mobile billing application for users who are commonly out of the office. The app is configured as a connected App in salesforce. Due to the nature of this app, UC would like to take the appropriate measures to properly secure access to the app. Which two are recommendations to make the UC? Choose 2 answers

- A. Disallow the use of single Sign-on for any users of the mobile app.
- B. Use Google Authenticator as an additional part of the logical processes.
- C. Require high assurance sessions in order to use the connected App
- D. Set login IP ranges to the internal network for all of the app users profiles.

Answer: B,C

NEW QUESTION # 188
Northern Trail Outfitters (NTO) is planning to implement a community for its customers using Salesforce Experience Cloud.
Customers are not able to self-register. NTO would like to have customers set their own passwords when provided access to the community.
Which two recommendations should an identity architect make to fulfill this requirement?
Choose 2 answers

- A. Allow Password reset using the API to update Experience Cloud site membership.
- B. Enable Welcome emails while configuring the Experience Cloud site.
- C. Use Login Flows to allow users to reset password in Experience Cloud site.
- D. Add customers as contacts and add them to Experience Cloud site.

Answer: A,C

Explanation:
Allowing password reset using the API and using login flows are two possible ways to enable customers to set their own passwords in Experience Cloud. The other options are not relevant for this requirement, as they do not address the password issue. References: Allow Password Reset Using the API, Use Login Flows to Allow Users to Reset Passwords in Experience Cloud Sites

NEW QUESTION # 189
Universal Containers (UC) is setting up delegated authentication to allow employees to log in using their corporate credentials. UC's security team is concerned about the risks of exposing the corporate login service on the internet and has asked that a reliable trust mechanism be put in place between the login service and Salesforce.
What mechanism should an Architect put in place to enable a trusted connection between the login service and Salesforce?

- A. Require the use of Salesforce security tokens on passwords.
- B. Enforce mutual authentication between systems using SSL.

- C. Set up a proxy service for the login service in the DMZ.
- D. Include Client Id and Client Secret in the login header callout.

Answer: A

NEW QUESTION # 190

After a recent audit, universal containers was advised to implement Two-factor Authentication for all of their critical systems, including salesforce. Which two actions should UC consider to meet this requirement?
Choose 2 answers

- A. Require users to supply their email and phone number, which gets validated.
- B. Require users to enter a second password after the first Authentication
- C. Require users to use a biometric reader as well as their password
- D. Require users to provide their RSA token along with their credentials.

Answer: C,D

Explanation:
A is correct because requiring users to provide their RSA token along with their credentials is a form of two- factor authentication. An RSA token is a hardware device that generates a one-time password (OTP) that changes every few seconds. The user needs to enter both their password and the OTP to log in to Salesforce.
D is correct because requiring users to use a biometric reader as well as their password is another form of two- factor authentication. A biometric reader is a device that scans a user's fingerprint, face, iris, or other physical characteristics to verify their identity. The user needs to provide both their password and their biometric data to log in to Salesforce.
B is incorrect because requiring users to supply their email and phone number, which gets validated, is not a form of two-factor authentication. This is a form of identity verification, which is used to confirm that the user owns the email and phone number they provided. However, this does not add an extra layer of protection beyond their password when they log in to Salesforce.
C is incorrect because requiring users to enter a second password after the first authentication is not a form of two-factor authentication. This is a form of single-factor authentication, which only relies on something the user knows (their passwords). This does not increase security against unauthorized account access.

NEW QUESTION # 191

Universal Containers (UC) has an existing web application that it would like to access from Salesforce without requiring users to re-authenticate. The web application is owned UC and the UC team that is responsible for it is willing to add new javascript code and/or libraries to the application. What implementation should an Architect recommend to UC?

- A. Create a Canvas app and use Signed Requests to authenticate the users.
- B. Configure the web application as an item in the Salesforce App Launcher.
- C. Add the web application as a ConnectedApp using OAuth User-Agent flow.
- D. Rewrite the web application as a set of Visualforce pages and Apex code.

Answer: A

Explanation:
A Canvas app is a web application that can be embedded within Salesforce and access Salesforce data using the signed request authentication method. This method allows the Canvas app to receive a signed request that contains the context and OAuth token when it is loaded. The Canvas app can use the SDK to request a new or refreshed signed request on demand2. This way, the users do not need to re-authenticate when accessing the web application from Salesforce.
