## Testing CS0-003 Center | CS0-003 Books PDF

Our CS0-003 real study guide materials can help you get better and better reviews. This is a very intuitive standard, but sometimes it is not enough comprehensive, therefore, we need to know the importance of getting the test CS0-003 certification, qualification certificate for our future job and development is an important role. Only when we have enough qualifications to prove our ability can we defeat our opponents in the harsh reality. We believe our CS0-003 actual question will help you pass the CS0-003 qualification examination and get your qualification faster and more efficiently.

## CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q381-Q386):

### NEW QUESTION # 381

Which of the following best explains the importance of the implementation of a secure software development life cycle in a company with an internal development team?

- A. Increases the product price by using the implementation as a piece of marketing

- B. Transfers the responsibility for security flaws to the vulnerability management team
- C. Improves the agile process and decreases the amount of tests before the final deployment
- D. **Decreases the risks of the software usage and complies with regulatory requirements**

**Answer: D**

Explanation:

A Secure Software Development Life Cycle (SDLC) integrates security measures at each stage of development to reduce vulnerabilities and improve the overall security of the software. This is essential for minimizing risks related to software usage and ensuring compliance with regulatory requirements, which is particularly important for organizations handling sensitive data. As per CompTIA standards, a Secure SDLC helps prevent security breaches and protects both the organization and its users from potential harm.

**NEW QUESTION # 382**

A security analyst is reviewing the logs of a web server and notices that an attacker has attempted to exploit a SQL injection vulnerability. Which of the following tools can the analyst use to analyze the attack and prevent future attacks?

- A. A vulnerability scanner
- B. **A web application firewall**
- C. A web proxy
- D. A network intrusion detection system

**Answer: B**

Explanation:

A web application firewall (WAF) is a tool that can protect web servers from attacks such as SQL injection, cross-site scripting, and other web-based threats. A WAF can filter, monitor, and block malicious HTTP traffic before it reaches the web server. A WAF can also be configured with rules and policies to detect and prevent specific types of attacks.

**NEW QUESTION # 383**

Each time a vulnerability assessment team shares the regular report with other teams, inconsistencies regarding versions and patches in the existing infrastructure are discovered. Which of the following is the best solution to decrease the inconsistencies?

- A. Implementing credentialled scanning
- B. **Implementing a central place to manage IT assets**
- C. Changing from a passive to an active scanning approach
- D. Performing agentless scanning

**Answer: B**

**NEW QUESTION # 384**

A security analyst receives an alert for suspicious activity on a company laptop. An excerpt of the log is shown below:

□ Which of the following has most likely occurred?

- A. A phishing link in an email was clicked.
- B. **An Office document with a malicious macro was opened.**
- C. A web browser vulnerability was exploited.
- D. A credential-stealing website was visited.

**Answer: B**

**NEW QUESTION # 385**

A zero-day command injection vulnerability was published. A security administrator is analyzing the following logs for evidence of adversaries attempting to exploit the vulnerability:

Which of the following log entries provides evidence of the attempted exploit?

- A. Log entry 4
- B. Log entry 2
- C. Log entry 3
- D. Log entry 1

**Answer: A**

Explanation:

Log entry 4 shows an attempt to exploit the zero-day command injection vulnerability by appending a malicious command (`;cat /etc/passwd`) to the end of a legitimate request (`/cgi-bin/index.cgi?name=John`). This command would try to read the contents of the `/etc/passwd` file, which contains user account information, and could lead to further compromise of the system. The other log entries do not show any signs of command injection, as they do not contain any special characters or commands that could alter the intended behavior of the application.
