

Premium Analytics-Arch-201 Files, Latest Analytics-Arch-201 Test Notes

P.S. Free 2026 Salesforce Analytics-Arch-201 dumps are available on Google Drive shared by TestPDF:
https://drive.google.com/open?id=1aAPnvAs_7MyZPkXIr7NByxSNAM99GNwB

The Desktop Salesforce Analytics-Arch-201 Practice Exam Software contains real Salesforce Analytics-Arch-201 exam questions. This provides you with a realistic experience of being in an Salesforce Analytics-Arch-201 examination setting. This feature assists you in becoming familiar with the layout of the Salesforce Analytics-Arch-201 test and enhances your ability to do well on Salesforce Certified Tableau Architect (Analytics-Arch-201) examination.

Salesforce Analytics-Arch-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.
Topic 2	<ul style="list-style-type: none"> • Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.
Topic 3	<ul style="list-style-type: none"> • Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.

Prominent Features of TestPDF Salesforce Analytics-Arch-201 Exam Questions

Since the software keeps a record of your attempts, you can overcome mistakes before the Analytics-Arch-201 final exam attempt. Knowing the style of the Salesforce Analytics-Arch-201 examination is a great help to pass the test and this feature is one of the perks you will get in the desktop practice exam software.

Salesforce Certified Tableau Architect Sample Questions (Q200-Q205):

NEW QUESTION # 200

During the migration of Tableau Server from Windows to Linux, what key aspect should be addressed to maintain performance and stability?

- A. Only transferring the most frequently used dashboards to reduce the load on the Linux server
- B. Neglecting the testing of data connections post-migration, assuming they will remain stable
- C. Changing the underlying database platform to better suit the Linux environment
- **D. Conducting comprehensive testing of the Tableau Server on Linux, including data source connections and performance benchmarks**

Answer: D

Explanation:

Conducting comprehensive testing of the Tableau Server on Linux, including data source connections and performance benchmarks. Comprehensive testing is essential to ensure that the Tableau Server maintains its performance and stability in the new Linux environment, including verifying data connections and performance standards. Option A is incorrect because neglecting the testing of data connections can lead to critical issues post-migration. Option C is incorrect as only transferring frequently used dashboards does not address the overall stability and performance of the server. Option D is incorrect because changing the database platform is not necessarily required for a migration from Windows to Linux and could introduce unnecessary complexities.

NEW QUESTION # 201

In the process of configuring OpenID Connect for Tableau Server, what is a critical step to ensure secure and efficient authentication?

- A. Configuring the Tableau Server to accept all OpenID Connect providers without validation
- **B. Registering Tableau Server as a client with the OpenID Connect provider and obtaining client credentials**
- C. Setting up a direct database connection from Tableau Server to the OpenID Connect provider's database
- D. Disabling all other forms of authentication on Tableau Server to enforce OpenID Connect exclusively

Answer: B

Explanation:

Registering Tableau Server as a client with the OpenID Connect provider and obtaining client credentials. For secure and efficient authentication using OpenID Connect, it is essential to register the Tableau Server as a client with the OpenID Connect provider. This involves obtaining client credentials (client ID and client secret), which are used to authenticate requests from Tableau Server to the provider, ensuring secure communication and identity verification. Option A is incorrect because accepting all OpenID Connect providers without validation poses significant security risks. Option C is incorrect as setting up a direct database connection to the provider's database is not a standard or secure practice for configuring OpenID Connect. Option D is incorrect because disabling all other forms of authentication is not necessary and could limit flexibility and accessibility for users.

NEW QUESTION # 202

In the context of troubleshooting trusted authentication issues on Tableau Server, what is a common factor to examine?

- A. The network latency between Tableau Server and the third-party application
- B. The validity of SSL certificates on both Tableau Server and the third-party application
- C. The data encryption method used by Tableau Server and the third-party application
- **D. The synchronization of system clocks between Tableau Server and the third-party application**

Answer: D

Explanation:

The synchronization of system clocks between Tableau Server and the third-party application A common issue in trusted authentication is the lack of synchronization in system clocks between Tableau Server and the third-party application. Because trusted authentication often involves time-sensitive tokens, discrepancies in system times can lead to failed authentication attempts. Ensuring synchronized clocks is crucial for the smooth functioning of trusted authentication. Option A is incorrect because while data encryption is important, it is not typically the cause of trusted authentication-specific issues. Option B is incorrect as SSL certificate validity, though crucial for secure connections, is not usually the direct cause of issues in trusted authentication. Option D is incorrect because network latency, while affecting overall performance, does not typically impact the functionality of trusted authentication.

NEW QUESTION # 203

A company is experiencing high demand for complex data processing tasks in its Tableau environment. To optimize performance, when should the company consider using external services?

- A. Use external services for all data processing tasks, regardless of complexity
- **B. For complex data blending and analytics tasks that are resource-intensive**
- C. External services should never be used with Tableau Server
- D. Only for basic data visualization tasks to reduce the load on Tableau Server

Answer: B

Explanation:

For complex data blending and analytics tasks that are resource-intensive Utilizing external services for complex and resource-intensive tasks like data blending and analytics can help in optimizing the performance of the Tableau environment by offloading these demanding processes. Option A is incorrect because basic data visualization tasks are typically well-handled by Tableau Server itself. Option C is incorrect as external services can be beneficial for specific resource-intensive tasks. Option D is incorrect because using external services for all tasks, regardless of complexity, can be inefficient and unnecessary.

NEW QUESTION # 204

For a large organization using Tableau Server, what should be included in an automated complex disaster recovery plan to ensure rapid recovery of services?

- A. A single annual full backup of the Tableau Server, complemented by periodic manual checks
- **B. Frequent, automated backups of Tableau Server data, configuration, and content, stored in an off-site location**
- C. Continuous, real-time backups of all user interactions and changes on the Tableau Server
- D. Utilizing only RAID configurations for data storage to prevent data loss

Answer: B

Explanation:

Frequent, automated backups of Tableau Server data, configuration, and content, stored in an off-site location An effective component of an automated complex disaster recovery plan for a large organization's Tableau Server is the implementation of frequent, automated backups. These backups should include all critical data, configuration settings, and content, and they should be stored in an off-site location to protect against site-specific disasters. This approach ensures data integrity and enables rapid recovery of services in the event of a disaster. Option B is incorrect because a single annual backup is insufficient for a comprehensive disaster recovery strategy and does not account for frequent data changes. Option C is incorrect as continuous, real-time backups of all user interactions are generally not feasible and may be excessive for disaster recovery needs. Option D is incorrect because relying solely on RAID configurations, while useful for data redundancy, does not constitute a complete disaster recovery solution. RAID does not replace the need for regular off-site backups.

NEW QUESTION # 205

.....

Being anxious for the exam ahead of you? Have a look of our Analytics-Arch-201 training engine please. Presiding over the line of our Analytics-Arch-201 practice materials over ten years, our experts are proficient as elites who made our Analytics-Arch-201 learning questions, and it is their job to officiate the routines of offering help for you. And i can say no people can know the Analytics-Arch-201 exam braindumps better than them since they are the most professional.
