It includes a comparative review of interaction patterns such as batch, stream, and multicast, as well as integration composition styles like orchestration and choreography. The section emphasizes the use of design-first API development, observability practices, and log management. It also introduces architecture concepts such as microservices versus monolithic deployment, hybrid and cloud infrastructure, and the roles of API gateways and service meshes.

Salesforce Certified MuleSoft Associate Sample Questions (Q34-Q39):

NEW QUESTION # 34

Which component of Anypoint Platform belongs to the platform control plane?"

- A. Runtime Fabric
- B. Runtime Replica
- C. Anypoint Connectors
- D. API Manager

Answer: D

Explanation:

In Anypoint Platform, the control plane is responsible for managing and controlling the various components and services that make up the platform. API Manager is part of the control plane, providing centralized management of APIs. Here's a detailed explanation:

Control Plane:

Definition: The control plane in Anypoint Platform is responsible for the management, monitoring, and control of APIs, applications, and other platform resources.

Components: Includes tools for API management, analytics, security, and governance.

API Manager:

Purpose: Allows users to manage API policies, monitor API usage, and secure APIs. It provides a centralized interface for managing the entire lifecycle of APIs.

Features:

Policy Enforcement: Apply security policies, rate limiting, and other governance rules.

Analytics and Monitoring: Track API performance, usage statistics, and detect anomalies.

Access Control: Manage user access and permissions for APIs.

MuleSoft Documentation: API Manager

NEW QUESTION # 35

During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.

Which characteristics of a design-first approach will help make this API successful?

- A. Adding global policies to the API so all developers automatically secure the implementation before coding anything
- B. Publishing the fully implemented API to Exchange so all developers can reuse the API
- C. Developing a specification so consumers can test before the implementation is built
- D. Building MUnit tests so administrators can confirm code coverage percentage during deployment

Answer: C

Explanation:

A design-first approach emphasizes creating the API specification before implementation, ensuring better alignment with consumer needs and reducing the risk of project failure. Here's a detailed explanation:

API Specification:

Definition: An API specification is a detailed, formal description of the API's endpoints, request/response formats, and protocols.

Consumer Testing: Allows API consumers (developers) to understand, test, and provide feedback on the API design before actual development begins.

Advantages:

Early Feedback: Consumers can test the API design using mock services or tools like API Designer and provide feedback, ensuring the API meets their requirements.

Reduced Rework: Identifies potential issues and design flaws early, reducing costly changes during the implementation phase.

Documentation: Provides comprehensive documentation that aids in the development and future maintenance of the API.

Design-First Approach: Design-First API Development

API Mocking: API Designer Mocking Service

NEW QUESTION # 36

An application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway Which protocol is involved in the communication between the load balancer and the Gateway?

- A. HTTPS
- B. LDAP
- C. SMTP
- D. SFTP

Answer: A

Explanation:

In scenarios where an application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway, HTTPS is the protocol used. Here's a detailed explanation:

HTTPS Protocol:

Definition: HTTPS (HyperText Transfer Protocol Secure) is an extension of HTTP that provides secure communication over a computer network.

Encryption: It uses SSL/TLS to encrypt the data exchanged between the client and server, ensuring privacy and data integrity.

Load Balancer to Gateway Communication:

Secure Communication: The load balancer routes incoming requests to the API Gateway using HTTPS, ensuring that the data is encrypted and secure.

Standard Practice: HTTPS is the standard protocol for securing API communications, protecting against eavesdropping and man-in-the-middle attacks.

HTTPS Protocol: What is HTTPS?

API Gateway Security: Anypoint Flex Gateway

NEW QUESTION # 37

An integration team follows MuleSoft's recommended approach to full lifecycle API development Which activity should this team perform during the API implementation phase?

- A. Design the API specification
- B. Use the API specification to build the MuleSoft application
- C. Validate the API specification
- D. Use the API specification to monitor the MuleSoft application

Answer: B

Explanation:

MuleSoft recommends a full lifecycle API development approach which includes several phases such as design, implementation, testing, deployment, and management. During the API implementation phase, the primary activity is to use the API specification to build the MuleSoft application. Here's a detailed explanation:

API Design:

Create API Specification: Initially, an API specification is created using RAML or OAS (OpenAPI Specification) to define the API's structure, endpoints, request/response formats, and security requirements.

API Implementation:

Build Mule Application: Using the API specification as a blueprint, the development team implements the MuleSoft application. This involves creating flows, integrating with backend systems, and ensuring the API functions as specified.

APIKit: MuleSoft provides APIKit, a tool that automatically generates Mule flows based on the API specification, speeding up the development process.

Testing: During implementation, unit tests (using MUnit) and integration tests are created to ensure the API behaves as expected.

Validation and Monitoring:

Validate Against Specification: Throughout the implementation phase, the API is continuously validated against the original specification to ensure compliance.

Deployment and Monitoring: Post-implementation, the API is deployed, and tools like Anypoint Monitoring are used to monitor its performance and usage.

MuleSoft Documentation: Full Lifecycle API Management

APIKit: Building APIs with APIKit
