## Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q93-Q98):

### NEW QUESTION # 93

When should a crossover UTP cable be used instead of a straight-through cable when connecting network devices?

- A. To connect electrically like devices
- B. To connect a switch to a router
- C. To connect electrically unlike devices
- D. To connect a PC to a wireless access point

**Answer: A**

Explanation:

Crossover UTP (Unshielded Twisted Pair) cables are used to connect two similar devices directly. This includes:

- \* Switch to switch
- \* Router to router
- \* PC to PC

The crossover cable reverses the transmit and receive pairs, allowing for proper communication between like devices without the need for an intermediary device.

Conversely, straight-through cables are used to connect dissimilar devices, such as:

- \* PC to switch
- \* Router to switch
- \* PC to router

This cable maintains the same wiring on both ends, suitable for connecting different types of devices.

Therefore, when connecting electrically like devices, a crossover cable is appropriate.

#### NEW QUESTION # 95

How must the power to a system with dual power supplies on a Cisco Nexus switch be connected?

- A. Connect the primary power supply to the main source and the secondary to a backup generator.
- **B. Connect each power supply to a separate power source.**
- C. Connect both power supplies to a single power source.
- D. Connect both power supplies to a power distribution unit with built-in redundancy.

**Answer: B**

Explanation:

In a Cisco Nexus switch with dual power supplies, the recommended method is to connect each power supply to a separate power source (Option C). This ensures power redundancy and fault tolerance.

If one power source fails (e.g., due to a power outage or circuit failure), the switch can continue operating uninterrupted using the second power source. Connecting both to a single source (Option D) defeats the purpose of redundancy.

#### NEW QUESTION # 96

Which component of the Cisco Room system requires removal of the upper textile grille and the use of release levers during its replacement process?

- **A. Quad camera**
- B. Codec
- C. Loudspeaker
- D. Antenna module

**Answer: A**

Explanation:

In Cisco Room systems such as the Room Kit Pro and similar setups, replacing the quad camera involves a physical disassembly process. Specifically, the upper textile grille must be removed to gain access to the internal mounting mechanism. After that, release levers are used to disengage the quad camera unit from its housing.

This procedure ensures secure installation while allowing relatively straightforward removal when maintenance or replacement is necessary. The codec, loudspeaker, and antenna module do not typically require this specific removal method.

## NEW QUESTION # 97

Drag and drop the configuration tasks for restoring software from the left onto the corresponding commands on the right.

### Answer:

Explanation:

Explanation:

These command associations are part of Cisco IOS essentials taught in FLDTEC's "Device Configuration and Verification" topic. Here's how each command functions:

show running-config

Displays the active configuration stored in RAM.

This command is used to verify the current settings on a Cisco device.

copy running-config startup-config

Saves the current running configuration to NVRAM, ensuring the configuration persists after a reboot.

This is critical after making changes to device settings.

copy tftp: running-config

Loads a configuration from a TFTP server and applies it to the current running configuration.

Often used during remote device setup or restoration.

copy usbflash0:backup.cfg running-config

Restores a saved configuration file from a USB drive.

Useful in field operations where physical backup media is used during maintenance.

These tasks are routine for field technicians performing configuration backups, restorations, and diagnostics in Cisco environments.
