CompTIA Security+ Certification Exam Sample Questions (Q865-Q870):

NEW QUESTION # 865
Which of the following is the final step of the modern response process?

- A. Recovery
- B. Containment
- C. Eradication
- D. Lessons learned

Answer: D

Explanation:
The final step in the incident response process is "Lessons learned." This step involves reviewing and analyzing the incident to understand what happened, how it was handled, and what could be improved. The goal is to improve future response efforts and prevent similar incidents from occurring. It's essential for refining the incident response plan and enhancing overall security posture.

NEW QUESTION # 866
A systems administrator needs to encrypt all data on employee laptops. Which of the following encryption levels should be implemented?

- A. File
- B. Partition
- C. Full disk

- D. Volume

Answer: C

NEW QUESTION # 867
A company receives an alert that a network device vendor, which is widely used in the enterprise, has been banned by the government.
Which of the following will the company's general counsel most likely be concerned with during a hardware refresh of these devices?

- A. Cost of replacement
- B. Loss of license
- C. Sanctions
- D. Data sovereignty

Answer: C

Explanation:
When the government bans a vendor, the primary concern for the company's general counsel is sanctions, which are legal restrictions that prohibit the purchase, use, import, or continued operation of products associated with restricted entities. Security+ SY0-701 stresses that compliance with government regulations and legal mandates is a critical oversight responsibility. Failure to comply may result in severe penalties, including fines, loss of contracting eligibility, and reputational damage.
During a hardware refresh, general counsel will ensure the organization is not violating federal trade sanctions, procurement laws, or export/import restrictions. Even if devices are already purchased, continued use may still violate the sanctions, creating legal liability.
Data sovereignty (B) relates to storage location requirements, not vendor bans. Cost of replacement (C) is an operational and financial concern, not a legal one. Loss of license (D) typically applies to software but is not the primary legal concern tied to a government-issued vendor ban.
Therefore, sanctions are the general counsel's primary focus.

NEW QUESTION # 868
Which of the following best describes configuring devices to log to an off-site location for possible future reference?

- A. DLP
- B. SCAP
- C. Log aggregation
- D. Archiving

Answer: C

Explanation:
Configuring devices to log to an off-site location for possible future reference is best described as log aggregation. Log aggregation involves collecting logs from multiple sources and storing them in a centralized location, often off-site, to ensure they are preserved and can be analyzed in the future.
Log aggregation: Centralizes log data from multiple devices, making it easier to analyze and ensuring logs are available for future reference.
DLP (Data Loss Prevention): Focuses on preventing unauthorized data transfer and ensuring data security.
Archiving: Involves storing data for long-term retention, which could be part of log aggregation but is broader in scope.
SCAP (Security Content Automation Protocol): A standard for automating vulnerability management and policy compliance.

NEW QUESTION # 869
A company prevented direct access from the database administrators' workstations to the network segment that contains database servers. Which of the following should a database administrator use to access the database servers?

- A. RADIUS
- B. HSM
- C. Load balancer
- D. Jump server

Answer: D

Explanation:
A jump server is a device or virtual machine that acts as an intermediary between a user's workstation and a remote network segment. A jump server can be used to securely access servers or devices that are not directly reachable from the user's workstation, such as database servers. A jump server can also provide audit logs and access control for the remote connections.
A jump server is also known as a jump box or a jump host.
RADIUS is a protocol for authentication, authorization, and accounting of network access.
RADIUS is not a device or a method to access remote servers, but rather a way to verify the identity and permissions of users or devices that request network access. HSM is an acronym for Hardware Security Module, which is a physical device that provides secure storage and generation of cryptographic keys. HSMs are used to protect sensitive data and applications, such as digital signatures, encryption, and authentication. HSMs are not used to access remote servers, but rather to enhance the security of the data and applications that reside on them5 .
A load balancer is a device or software that distributes network traffic across multiple servers or devices, based on criteria such as availability, performance, or capacity. A load balancer can improve the scalability, reliability, and efficiency of network services, such as web servers, application servers, or database servers. A load balancer is not used to access remote servers, but rather to optimize the delivery of the services that run on them .
