CGOA考古題介紹，CGOA最新題庫

隨著CGOA考試的變化，NewDumps已經跟新了考試問題和答案，包括一些新增的問題，通過使用更新版本的Linux Foundation CGOA考古題，您可以輕鬆快速的通過考試，還節約寶貴的時間。獲得CGOA認證之后，您的職業生涯也將開始新的輝煌時期。購買我們的Linux Foundation CGOA題庫資料可以保證考生一次性通過考試，這是值得大家信賴的題庫網站，可以幫大家減少考試成本，節約時間，是上班族需要獲取CGOA認證的最佳選擇。

最新的 DevOps and Site Reliability CGOA 免費考試真題 (Q52-Q57):

問題 #52

In the context of GitOps, what does Continuous mean?

- A. Reconciliation continues to happen.
- B. Reconciliation happens only during instantiation.
- C. Reconciliation only happens once.
- D. Reconciliation must happen instantaneously.

答案: A

解題說明:

One of the four core GitOps principles is that the system must be Continuously Reconciled. This means reconciliation is not a one-time or on-demand process but happens constantly in the background, ensuring the actual system state remains aligned with the declared desired state.

"GitOps requires that reconciliation is continuous. Software agents continuously compare actual state against desired state and automatically reconcile differences." Thus, the correct answer is C.

References: GitOps Principles (CNCF GitOps Working Group), Principle 4: Continuously reconciled.

問題 #53

How can you achieve the declarative GitOps principle in managing infrastructure and applications?

- A. By periodically creating manual backups of your infrastructure configurations.
- **B. By defining and maintaining infrastructure and application configurations declaratively in a version- controlled system.**
- C. By using imperative scripting languages to automate infrastructure changes.
- D. By manually making ad-hoc configuration changes directly in the production environment.

答案: B

解題說明:

The first GitOps principle is Declarative Descriptions. This means the desired system configuration (for infrastructure, services, and applications) is expressed declaratively and stored in version control. Git becomes the single source of truth.

"The desired system state must be expressed declaratively. This provides a clear, machine-readable blueprint for the system, and ensures that what is in Git is what should be running in the environment." Therefore, infrastructure and application configurations must be defined declaratively and stored in Git, not managed imperatively or manually.

References: GitOps Principles (CNCF GitOps Working Group), Principle 1: The system is described declaratively.

問題 #54

Which of these is an advantage of using a declarative configuration for your Desired State?

- A. Declarative configuration lets you specify complex if/else logic within custom code.
- **B. Using widely adopted community tools for reconciling actual state is less work than maintaining custom imperative scripts.**
- C. Declarative configuration allows you to execute code locally more efficiently to make desired changes to your running system.
- D. Declarative configuration helps you include dynamic scripting that guides an application through a step- by-step process.

答案: B

解題說明:

Declarative configuration describes what the system should look like, not how to achieve it. This enables the use of standard reconciliation tools (like ArgoCD or Flux) to manage the system automatically, removing the burden of writing and maintaining imperative scripts.

"Declarative configuration enables systems to be managed by generic reconciliation tools rather than bespoke scripts, reducing operational overhead and increasing reliability." Thus, the correct answer is B.

References: GitOps Principles (CNCF GitOps Working Group), Declarative Systems.

問題 #55

Which of the following statements accurately describes the role of GitOps in progressive delivery?

- A. GitOps does not allow end users to perform progressive delivery automatically, only manually.
- **B. GitOps allows end users to perform progressive delivery automatically without manually shifting traffic.**
- C. GitOps only works with manual progressive delivery without any automation.
- D. GitOps requires end users to manually shift traffic for progressive delivery.

答案: B

解題說明:

Progressive delivery is a GitOps pattern that incrementally rolls out application updates, using methods like canary releases, feature flags, and blue-green deployments. GitOps enhances this by ensuring the rollout is automated and declaratively managed through Git, removing the need for manual traffic switching.

"GitOps enables progressive delivery by declaratively managing rollout strategies such as canary or blue- green deployments. These strategies are applied automatically by controllers, without requiring manual traffic switching." Thus, the correct answer is B.

References: GitOps Patterns (CNCF GitOps Working Group), Progressive Delivery practices.

問題 #56

You are working on a GitOps project and want to trigger a reconcile process before the next scheduled reconciliation. What is the recommended way to do this?

- A. Use a webhook to trigger the reconcile process based on events or changes in the Git repository.
- B. Schedule a cron job to run the reconcile process periodically, using RBAC to authenticate.
- C. Adjust the reconcile process interval time.
- D. Manually execute a script to initiate the reconcile process on the cluster using GitOps tool CLI commands.

答案：A

解題說明：

Although reconciliation is continuous in GitOps, tools often allow reconciliation to be triggered earlier than the normal polling interval. The recommended approach is to use webhooks from the Git repository, which notify the GitOps controller of changes and trigger an immediate reconcile.

"While reconciliation loops continuously compare desired and actual state, reconciliation can be triggered sooner by webhooks from version control events, ensuring timely application of changes." Thus, the correct answer is A.
