## VMware Cloud Foundation 5.2 Administrator Sample Questions (Q129-Q134):

### NEW QUESTION # 129

An organization is integrating VMware vCenter with Active Directory (AD) to streamline user authentication.

As part of this process, the administrator needs to add AD as an identity source in vCenter.

Which three steps must be performed to successfully add AD as an identity source? (Choose three.)

- A. Enter the Domain Name and the credentials of an AD user with a minimum of read-only access to Base DN for users and groups.
- B. Select 'Identity Sources' and choose 'Active Directory Domain'.
- C. Configure DNS settings on all ESXi hosts to point to the AD DNS servers.

- D. Reboot the vCenter to apply the identity source settings.
- E. Navigate to the vCenter Single Sign-On configuration in the vSphere Client.
- F. Create an Active Directory object for the vCenter Server Appliance.

**Answer: A,B,E**

Explanation:

You must provide the AD domain name plus credentials (read-only is sufficient) to bind and query the Base DN for users and groups.

In the vSphere Client's Identity Sources section, choose "Active Directory Domain" when adding a new source.

These options are found under Administration # Single Sign-On # Configuration # Identity Sources in the vSphere Client.

### NEW QUESTION # 130

An administrator is troubleshooting a high CPU usage issue in a VMware Cloud Foundation environment running IaaS Control Plane. Several namespaces are reporting degraded performance.

What two steps should the administrator take to diagnose and potentially resolve the issue? (Choose two.)

- A. Upgrade the vSphere version to the latest release.
- B. Review the CPU usage of the ESXi hosts to identify any that are overcommitted.
- C. Check the resource limits and reservations set on the Kubernetes namespaces.
- D. Reboot the supervisor cluster to clear any temporary issues.
- E. Reconfigure the DRS settings to be more aggressive in load balancing.

**Answer: B,C**

Explanation:

The administrator should review the CPU usage of the ESXi hosts to identify if any hosts are overcommitted. Overcommitted hosts can lead to performance degradation across workloads.

Checking the resource limits and reservations on Kubernetes namespaces is crucial. If the resource limits are too low or improperly configured, it could cause degraded performance for workloads running in those namespaces.

### NEW QUESTION # 131

An administrator is troubleshooting a high CPU usage issue of the SDDC Manager VM. Access to SDDC Manager UI is exhibiting degraded performance.

What two steps should the administrator take to diagnose the issue? (Choose two.)

- A. Upgrade the vSphere version to the latest release.
- B. Review the CPU usage of the ESXi management domain hosts to identify any that are overcommitted.
- C. Login to SDDC Manager using console with root credentials, run the top command to identify any services that may be consuming high %CPU.
- D. Reboot the SDDC Manager VM to clear any temporary issues.
- E. Reconfigure the DRS settings to be more aggressive in load balancing.

**Answer: B,C**

Explanation:

When troubleshooting high CPU usage on the SDDC Manager VM, the recommended diagnostic steps are:

Login to SDDC Manager using console with root credentials, run the top command to identify any services that may be consuming high %CPU (B): The official documentation instructs administrators to use system monitoring commands such as top or htop within the SDDC Manager appliance to determine if specific processes or services are causing elevated CPU usage. This helps pinpoint the root cause inside the VM.

Review the CPU usage of the ESXi management domain hosts to identify any that are overcommitted (D):

High CPU usage within the SDDC Manager VM could also result from overall CPU contention on the physical ESXi hosts.

Checking host-level CPU usage can help determine if the underlying infrastructure is contributing to the performance issue. The documentation emphasizes reviewing host resource metrics to ensure the management cluster is not overcommitted.

Other options such as rebooting the VM, upgrading vSphere, or modifying DRS settings are not recommended as initial diagnostic steps according to official guidance. Rebooting or changing configurations without proper analysis may disrupt services or not address the root cause.

### NEW QUESTION # 132

A single VM is unable to communicate with other VMs on the same network. An administrator needs to identify and resolve the network connectivity issue.

What three steps should the administrator follow? (Choose three.)

- A. Verify that the networking within the VMs guest OS is correct.
- B. Ensure that the Port Group name(s) associated with the VMs network adapter exists in the vSwitch or VDS and is spelled correctly
- C. Verify that the virtual network adapter is present and connected.
- D. Use the ESXi command line to check the status of the VM Kernel adapter.
- E. Restart the VM to reset its network connections.

**Answer: A,B,C**

Explanation:

Ensuring the guest OS network configuration (IP, subnet mask, gateway) is correct rules out misconfiguration within the VM.

Confirming the virtual NIC is present and connected verifies the VM's link to the virtual switch.

Checking that the port group name exists and is correct ensures the VM is attached to the intended network segment.

### NEW QUESTION # 133

An organization needs to perform maintenance on a specific host in a vSAN cluster. An administrator is required to put the host into maintenance mode whilst ensuring that all VMs in the cluster remain accessible.

Which three steps should the administrator take to correctly set a vSAN host into maintenance mode? (Choose three.)

- A. Navigate to the vSAN cluster in the vSphere Client and select the host.
- B. Migrate all VMs manually from the host before enabling maintenance mode.
- C. Select the "No Data Migration" option to speed up the process.
- D. Choose the "Ensure Accessibility" option to maintain data accessibility.
- E. Right-click the host and select "Enter Maintenance Mode."

**Answer: A,D,E**

Explanation:

The "Ensure Accessibility" option ensures that all data remains accessible during maintenance while minimizing the impact on performance and data migration.

The administrator must navigate to the vSAN cluster in the vSphere Client to select the host for maintenance mode.

Right-clicking the host and selecting "Enter Maintenance Mode" is the standard action for placing a host into maintenance mode.
