EMC Dell Technologies PowerMax Operate Sample Questions (Q20-Q25):

NEW QUESTION # 20

What does the symsan command do when scanning the SAN environment for devices to use in an O-MDM session?

- A. Verifies the SAN configuration and creates an ORS session on the remote host
- B. Temporarily stops the remote application and creates an ORS session
- C. Temporarily stops the remote application to verify the SAN configuration
- **D. Verifies the SAN configuration without disruption to the remote host**

Answer: D

Explanation:

Step by Step Comprehensive Detailed Explanation:

The symsan command in Solutions Enabler is used for various SAN (Storage Area Network) management tasks. One of its functions is to scan the SAN environment to discover and verify the configuration of devices and paths.

When used in the context of an Open Replicator Migrator for Dell EMC (O-MDM) session, the symsan command specifically:

* Verifies SAN Configuration:It checks the connectivity and configuration of the SAN fabric to ensure that the source and target devices are accessible and properly configured for the migration.

* Non-Disruptive:It performs this verification without disrupting any applications or host I/O operations on the remote host. This is crucial for maintaining business continuity during the migration planning phase.

Why other options are incorrect:

* A. Temporarily stops the remote application to verify the SAN configuration:symstan does not stop applications; it performs a non-disruptive scan.

* B. Verifies the SAN configuration and creates an ORS session on the remote host:symstan only verifies the SAN; it doesn't create ORS (Open Replicator Solutions) sessions.

* D. Temporarily stops the remote application and creates an ORS session:Again, symstan doesn't stop applications or create ORS sessions.

References and documents of Dell's public documentation for PowerMax Operate v.2:

* Dell Solutions Enabler 10.0.0 CLI User Guide:This guide provides detailed information about the symstan command and its various options, including its use for SAN discovery and verification. You can find this document on the Dell Support website by searching for "Solutions Enabler CLI User Guide."

* Dell PowerMax Family: Essentials and Best Practices Guide:This guide may offer general information about SAN management and migration tools, providing context for understanding the role of the symstan command.

NEW QUESTION # 21

The Reserved Capacity for a PowerMax Storage Resource Pool (SRP) has been set to 15%. A TimeFinder SnapVX snapshot has been created for a Storage Group containing 10 devices. An application is actively performing read and write I/Os to these devices. The snapshot is linked to the target in Copy mode. Allocation for the SRP reaches 85%.

What will happen to the copy process?

- **A. Copy to target will halt**
- B. Copy to target will continue and complete
- C. Array increases compression to free up space
- D. Copy to target will fail

Answer: A

NEW QUESTION # 22

Which Unisphere for PowerMax client connection authentication type is irrevocable once it is selected?

- A. Windows AD Domain-based
- B. LDAP - SSL
- **C. x.509 Common/Principal Name**
- D. Multi-factor Authentication

Answer: C

NEW QUESTION # 23

What are two characteristics of a SnapVX Clone?

- A. Restores directly to the source volume
- B. Can be made secure
- C. Can be made crash consistent
- D. Is Read-only
- E. Maximum 1024 snaps per volume

Answer: B,C

Explanation:

Step by Step Comprehensive Detailed Explanation:

* SnapVX Clones: SnapVX clones are full, writable copies of a source volume created using the SnapVX snapshot technology.

They are independent volumes that can be used for various purposes, such as testing, development, or data analysis.

* Secure Snapshots: SnapVX offers the capability to create "secure snapshots." When a clone is derived from a secure snapshot, it inherits the same protection, making it immutable and preventing any modifications or deletion. This ensures data integrity and protection against accidental or malicious changes.

* Crash Consistent: SnapVX clones can be made crash consistent. This means that the clone captures a point-in-time copy of the source volume that is consistent with a database or application crash. This is important for ensuring data integrity and recoverability in situations where the source volume experiences an unexpected outage.

Why other options are incorrect:

* A. Maximum 1024 snaps per volume: This limit applies to the source volume, not the clones themselves. Each clone is an independent volume.

* C. Restores directly to the source volume: Clones are independent copies and do not directly restore to the source volume. Data can be copied or moved from the clone to the source if needed.

* D. Is Read-only: SnapVX clones are fully writable copies, not read-only.

References and documents of Dell's public documentation for PowerMax Operate v.2:

* Dell Solutions Enabler 10.0.0 TimeFinder SnapVX CLI User Guide: This guide provides detailed information about SnapVX features and commands, including how to create and manage clones. It confirms the ability to create secure clones and the option to make them crash consistent.

* Dell PowerMax Family: Essentials and Best Practices Guide: This guide offers a comprehensive overview of PowerMax technologies, including SnapVX. It highlights the benefits of SnapVX clones for various use cases.

NEW QUESTION # 24

Place the steps in the correct order to create clone copy sessions of device groups.

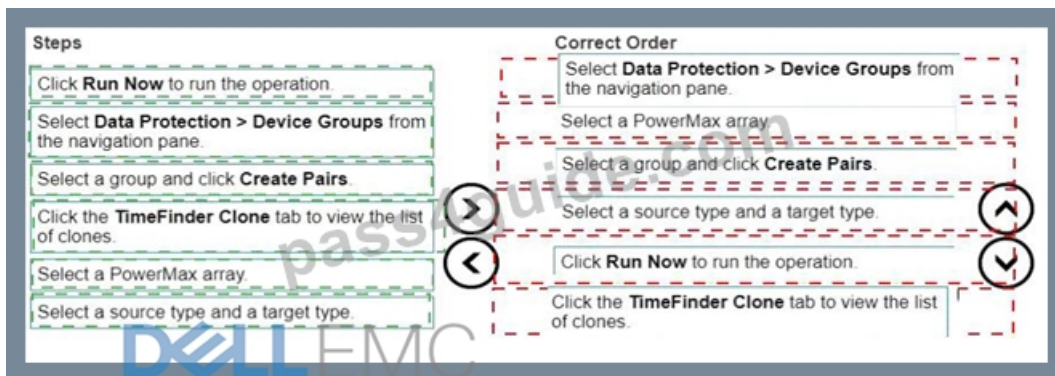

The screenshot shows a software interface for creating clone copy sessions. On the left, under the heading "Steps", there is a list of six steps in a box:

- Click **Run Now** to run the operation.
- Select **Data Protection > Device Groups** from the navigation pane.
- Select a group and click **Create Pairs**.
- Click the **TimeFinder Clone** tab to view the list of clones.
- Select a PowerMax array.
- Select a source type and a target type.

On the right, under the heading "Correct Order", there are two vertical columns of circular arrows. The left column has two arrows pointing right (one above the other), and the right column has two arrows pointing up (one above the other). A large, faint watermark "Dell EMC" is visible across the bottom of the interface.

Answer:

Explanation:

Explanation:

Here's the correct sequence of steps along with explanations:

Correct Order:

- * Select Data Protection > Device Groups from the navigation pane.
- * Why: This is the starting point within Unisphere for PowerMax. You need to navigate to the section where device groups are managed and where TimeFinder operations are initiated.
- * Select a PowerMax array.
- * Why: In an environment with multiple PowerMax arrays, you must specify the array on which you want to create the clone copy sessions.
- * Select a group and click Create Pairs.
- * Why: You are selecting the specific device group that will be the source for the clone operation and choosing the "Create Pairs" action to initiate the clone session creation process. This implies you are creating a clone from an existing group of devices.
- * Select a source type and a target type.
- * Why: This step defines the characteristics of the source and target devices for the clone session. This could involve selecting from different storage groups, specifying thin or thick provisioning, or other relevant settings. Note that in a clone context, the "target type" often refers to how the clone will be linked to the source (e.g., a full copy or a linked target).
- * Click Run Now to run the operation.
- * Why: After configuring all the settings for the clone session, this action triggers the actual creation of the clone pairs based on the selected source and target types and other parameters.
- * Click the TimeFinder Clone tab to view the list of clones.
- * Why: Once the operation has been initiated, this is how you would verify that the clone sessions were created successfully and monitor their status.
- * Select Data Protection > Device Groups from the navigation pane.
- * Select a PowerMax array.
- * Select a group and click Create Pairs.
- * Select a source type and a target type.
- * Click Run Now to run the operation.
- * Click the TimeFinder Clone tab to view the list of clones.
