Our company is a multinational company with sales and after-sale service of DevOps-SRE exam torrent compiling departments throughout the world. In addition, our company has become the top-notch one in the fields, therefore, if you are preparing for the exam in order to get the related certification, then the PeopleCert DevOps Site Reliability Engineer (SRE) exam question compiled by our company is your solid choice. All employees worldwide in our company operate under a common mission: to be the best global supplier of electronic DevOps-SRE Exam Torrent for our customers through product innovation and enhancement of customers' satisfaction. Wherever you are in the world we will provide you with the most useful and effectively DevOps-SRE guide torrent in this website, which will help you to pass the exam as well as getting the related certification with a great ease.

Peoplecert PeopleCert DevOps Site Reliability Engineer (SRE) Sample Questions (Q65-Q70):

NEW QUESTION # 65

Which of these approaches can alleviate linear scaling toil?

- A. Outsourcing development
- B. Using auto-scaling capabilities
- C. Switching cloud providers
- D. Manual scaling of services

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Linear-scaling toil refers to work whose effort increases proportionally to service growth, such as manually provisioning servers or handling capacity expansion. The Google SRE Book, Chapter "Eliminating Toil," explains:

"Toil is work that scales linearly with the size of your service. A core strategy for reducing toil is to introduce automation that breaks the linear relationship." Auto-scaling capabilities directly address linear-scaling toil by automating resource allocation based on load or demand. This prevents engineers from repeatedly and manually adjusting infrastructure as usage grows.

The SRE Workbook also emphasizes:

"Infrastructure automation such as auto-scaling removes a major source of linear scaling toil by ensuring that capacity adjusts automatically as services grow." Why the other options are incorrect:

- * A Manual scaling is linear-scaling toil, not a solution.
- * C Outsourcing development does not reduce operational toil.
- * D Switching cloud providers alone does not solve toil unless automation is introduced.

Thus, B is the correct answer.

NEW QUESTION # 66

An error budget policy is BEST described as being designed to do which of the following?

- A. Send alerts when error budget is at half
- B. Shift the locus toward more innovation
- C. **Decide when and how to intervene**
- D. Prevent introduction of significant bugs

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The SRE Workbook describes an Error Budget Policy as a formal decision-making framework that defines what actions to take when a service consumes its error budget. Specifically, Google writes: "An error budget policy establishes when and how teams must intervene, whether to pause releases, prioritize reliability work, or adjust processes." (SRE Workbook - Error Budget Policies). The purpose is to create predictable responses to reliability degradation-not simply alerting, innovation boosting, or bug prevention.

Option C best matches the definition: deciding when and how to intervene based on error budget burn.

Option A is only an alerting rule, not a policy.

Option B is an outcome of a healthy budget, not the policy's purpose.

Option D is too narrow and is not how error budgets are framed.

Thus, C is correct.

NEW QUESTION # 67

Which of the following BEST describes how to contribute to achieving higher levels of availability?

1. Measuring the critical aspects
2. Maintaining a close relationship with development teams
3. Measuring staff performance
4. Maintaining a close interval between detection and correction

- A. 1 and 2
- B. 2 and 3
- C. **1 and 4**
- D. 3 and 4

Answer: C

NEW QUESTION # 68

Which of the following BEST illustrates the role of a launch coordination engineer?

- A. A server engineer focused on rolling out a dynamically scaled application hosting environment
- B. A site reliability engineer focused on stabilizing manual tuning and event monitoring activities
- C. **A software engineer who acts as a consultant and liaison between the parties involved in a launch**
- D. A software developer focused on building efficient application startup and shutdown performance

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Google's SRE model includes the role of Launch Coordination Engineer (LCE), described in the SRE Book as: "an engineer who serves as the central liaison between product teams, SRE, and other stakeholders to ensure safe and reliable launches." (SRE Book - Chapter: Production Environment & Launch Coordination).

Their responsibilities include assessing launch readiness, ensuring SLOs are defined, facilitating cross-team communication, and managing risk associated with new service rollouts.

Option C precisely reflects this role: acting as a consultant and liaison across all parties involved in a launch.

Option A focuses on server engineering, which is not the focus of LCE.

Option B describes application-level performance work, unrelated to cross-team launch facilitation.

Option D describes operational tuning, not coordination.

Thus, C is the correct answer, capturing the SRE-defined launch coordination function.

NEW QUESTION # 69

Engineering operational work to scale with a growing application is BEST achieved by addressing which of the following issues?

- A. On-call rotations
- B. Interruptions
- **C. Toil**
- D. Staffing levels

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

One of the central goals of SRE is that operational work must scale sublinearly with service growth. The SRE Book states: "If operational load grows linearly with service size, the model is unsustainable. Eliminating toil is key to scaling operations." (SRE Book - Chapter: Eliminating Toil). Toil prevents scaling because it is manual, repetitive, and tied directly to human effort.

Option C is the only answer that reflects this principle: reducing or eliminating toil enables SRE teams to support growing applications without increasing human labor proportionally.

Option A (staffing levels) does not scale sustainably.

Option B (interruptions) relate to productivity but not true scalability.

Option D (on-call rotations) affects fatigue, not the scaling of operational work.

Thus, C is the correct and SRE-authentic answer.
