NEW QUESTION # 10
A platform architect includes both an API gateway and a service mesh in the architecture of a distributed application for communication management.
Which type of communication management does a service mesh typically perform in this architecture?

- A. Between services within the application
- B. Between application services and the firewall
- C. Between the application and external API clients
- D. Between the application and external API implementations

Answer: A

Explanation:
A service mesh is typically used to manage communication between microservices within a distributed application. Here's a detailed explanation:
Service Mesh:
Definition: A service mesh is a dedicated infrastructure layer that manages service-to-service communication within a microservices architecture.
Features: Provides features such as load balancing, service discovery, traffic management, and security (e.g., mutual TLS).
Intra-Application Communication:
Focus: It focuses on internal communication between microservices, ensuring reliability, security, and observability of inter-service communications.
Management: Handles retries, circuit breaking, and service-to-service authentication transparently.
API Gateway:
Complementary Role: While a service mesh manages internal microservice communications, an API gateway manages external client requests and provides a single entry point for external API clients.
Service Mesh Overview: What is a Service Mesh?
Service Mesh vs. API Gateway: Service Mesh and API Gateway Comparison

NEW QUESTION # 11
An application load balancer routes requests to a RESTful web API secured by Anypomt Flex Gateway Which protocol is involved in the communication between the load balancer and the Gateway?

- A. SFTP
- B. LDAP
- C. HTTPS
- D. SMTP

Answer: C

Explanation:
In scenarios where an application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway, HTTPS is the protocol used. Here's a detailed explanation:
HTTPS Protocol:
Definition: HTTPS (HyperText Transfer Protocol Secure) is an extension of HTTP that provides secure communication over a computer network.
Encryption: It uses SSL/TLS to encrypt the data exchanged between the client and server, ensuring privacy and data integrity.
Load Balancer to Gateway Communication:
Secure Communication: The load balancer routes incoming requests to the API Gateway using HTTPS, ensuring that the data is

encrypted and secure.
Standard Practice: HTTPS is the standard protocol for securing API communications, protecting against eavesdropping and man-in-the-middle attacks.
HTTPS Protocol: What is HTTPS?
API Gateway Security: Anypoint Flex Gateway

NEW QUESTION # 12
A developer needs to discover which API specifications have been created within the organization before starting a new project
Which Anypoint Platform component can the developer use to find and try out the currently released API specifications?

- A. Runtime Manager
- B. Anypoint Exchange
- C. API Manager
- D. Object Store

Answer: B

Explanation:
When a developer needs to discover which API specifications have been created within the organization before starting a new project, Anypoint Exchange is the component to use. Here's a detailed explanation:
Anypoint Exchange:
Purpose: Provides a centralized repository where developers can find and access API specifications, connectors, templates, and other reusable assets.
API Specifications: Developers can search for API specifications defined using RAML or OAS, review their details, and try them out using provided mock services.

API Specifications: Finding and Using APIs in Exchange

NEW QUESTION # 13
During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.
Which characteristics of a design-first approach will help make this API successful?

- A. Adding global policies to the API so all developers automatically secure the implementation before coding anything
- B. Publishing the fully implemented API to Exchange so all developers can reuse the API
- C. Developing a specification so consumers can test before the implementation is built
- D. Building MUnit tests so administrators can confirm code coverage percentage during deployment

Answer: C

Explanation:
A design-first approach emphasizes creating the API specification before implementation, ensuring better alignment with consumer needs and reducing the risk of project failure. Here's a detailed explanation:
API Specification:
Definition: An API specification is a detailed, formal description of the API's endpoints, request/response formats, and protocols.
Consumer Testing: Allows API consumers (developers) to understand, test, and provide feedback on the API design before actual development begins.
Advantages:
Early Feedback: Consumers can test the API design using mock services or tools like API Designer and provide feedback, ensuring the API meets their requirements.
Reduced Rework: Identifies potential issues and design flaws early, reducing costly changes during the implementation phase.
Documentation: Provides comprehensive documentation that aids in the development and future maintenance of the API.
Design-First Approach: Design-First API Development
