

100% Pass Quiz Salesforce - Analytics-Arch-201 - Salesforce Certified Tableau Architect–Reliable Certification Sample Questions

BTW, DOWNLOAD part of DumpsActual Analytics-Arch-201 dumps from Cloud Storage: https://drive.google.com/open?id=136ldZA9F9OnTpk6Ks_vYjJHYSJXzFH4H

Studying with updated Analytics-Arch-201 practice questions improve your skills of clearing the certification test in a short time. DumpsActual makes it easy for you to prepare successfully for the Analytics-Arch-201 Questions in a short time with Analytics-Arch-201 Dumps. The product of DumpsActual has been prepared under the expert supervision of thousands of experts worldwide.

Salesforce Analytics-Arch-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.
Topic 2	<ul style="list-style-type: none"> • Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.
Topic 3	<ul style="list-style-type: none"> • Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.

Free Analytics-Arch-201 Exam, Valid Braindumps Analytics-Arch-201 Book

You can learn Analytics-Arch-201 quiz torrent skills and theory at your own pace, and you are not necessary to waste your time on some useless books or materials and you will save more time and energy that you can complete other thing. We also provide every candidate who wants to get certification with free Demo to check our materials. It is time for you to realize the importance of our Analytics-Arch-201 Test Prep, which can help you solve these annoyance and obtain a Analytics-Arch-201 certificate in a more efficient and productive way.

Salesforce Certified Tableau Architect Sample Questions (Q113-Q118):

NEW QUESTION # 113

In the context of SSL encryption for Tableau Server, what factor is important to consider to maintain the effectiveness of the SSL implementation?

- A. Regularly updating the Tableau Server software to the latest version
- B. Increasing the bandwidth capacity of the network to accommodate SSL traffic
- C. Ensuring the SSL certificate covers all domain names and subdomains used by Tableau Server
- D. Configuring all user accounts in Tableau Server to require SSL for authentication

Answer: C

Explanation:

Ensuring the SSL certificate covers all domain names and subdomains used by Tableau Server When implementing SSL encryption in Tableau Server, it is important to ensure that the SSL certificate covers all domain names and subdomains used by the server. This ensures that SSL protection is applied consistently across the entire server environment, preventing security gaps that might occur if some parts of the domain are not covered. Option A is incorrect because while updating Tableau Server is important for overall security and functionality, it is not specific to maintaining the effectiveness of SSL implementation. Option C is incorrect as increasing bandwidth capacity is generally not required solely due to SSL traffic. Option D is incorrect because configuring user accounts to require SSL for authentication, while a good security practice, is not directly related to the effectiveness of the SSL certificate coverage on the server.

NEW QUESTION # 114

When configuring SAML (Security Assertion Markup Language) for authentication in Tableau Server, which of the following steps is essential for successful integration?

- A. Configuring Tableau Server to redirect all HTTP requests to HTTPS for secure communication
- B. Obtaining and installing an SSL certificate specifically for the SAML provider
- C. Importing the SAML provider's metadata into Tableau Server for proper identity provider configuration
- D. Enabling automatic user provisioning within the SAML provider to create Tableau Server accounts

Answer: C

Explanation:

Importing the SAML provider's metadata into Tableau Server for proper identity provider configuration Importing the SAML provider's metadata into Tableau Server is a crucial step in configuring SAML for authentication. This metadata contains necessary information like the identity provider's URL and certificate, which Tableau Server uses to establish a trust relationship and securely exchange authentication data. Option A is incorrect because automatic user provisioning within the SAML provider is not a requirement for SAML integration with Tableau Server. Option B is incorrect as redirecting HTTP to HTTPS, while a good security practice, is not specific to the configuration of SAML authentication. Option C is incorrect as the SSL certificate is typically installed on the Tableau Server, not specifically for the SAML provider.

NEW QUESTION # 115

For a financial institution using Tableau Server, which disaster recovery strategy would be most appropriate to safeguard against data loss and ensure regulatory compliance?

- A. A basic disaster recovery plan that focuses only on infrequent backups to an on-site server
- B. Implementing a cloud-only disaster recovery strategy without any on-premises backup solutions
- C. Opting for a low-cost disaster recovery option that involves manual backups on removable drives
- D. A robust disaster recovery plan with frequent, encrypted backups, off-site storage, and quick recovery mechanisms

Answer: D

Explanation:

A robust disaster recovery plan with frequent, encrypted backups, off-site storage, and quick recovery mechanisms For a financial institution, a comprehensive disaster recovery plan with frequent encrypted backups, off-site storage, and rapid recovery capabilities is essential to protect sensitive financial data and ensure compliance with regulatory standards. Option A is incorrect as infrequent backups and on-site storage may not meet the stringent requirements for data protection in finance. Option C is incorrect because manual backups on removable drives are not reliable or secure enough for financial data. Option D is incorrect as relying solely on a cloud-based solution may not comply with certain regulatory requirements for financial institutions.

NEW QUESTION # 116

When configuring the Metadata API in Tableau Server, which step is crucial for ensuring the API's effective performance and security?

- A. Regularly changing the API key to prevent unauthorized access
- B. Configuring the Metadata API to run on a separate server from the main Tableau Server
- C. Encrypting all Metadata API responses with an additional encryption layer
- D. Setting up rate limits to control the number of requests to the Metadata API

Answer: D

Explanation:

Setting up rate limits to control the number of requests to the Metadata API Setting up rate limits for the Metadata API is essential to manage the load on the Tableau Server and to prevent abuse of the API. Rate limiting helps to maintain the server's performance and stability by controlling the number and frequency of requests processed by the Metadata API. Option A is incorrect because regularly changing the API key, while a good security practice, is not specifically related to the performance and security of the Metadata API in operation. Option C is incorrect as running the Metadata API on a separate server is not a standard requirement and does not directly contribute to its effective performance. Option D is incorrect because adding an extra encryption layer to Metadata API responses is generally unnecessary and can add undue complexity, as the API should already operate under secure protocols.

NEW QUESTION # 117

In developing a custom view to monitor the performance of published data sources in Tableau Server, which part of the Tableau repository schema should be primarily analyzed?

- A. The 'data_connections' table to gain insights into connections and performance of published data sources
- B. The 'server_usage' table to understand the overall server load and its impact on data source performance
- C. The 'users' table to identify active users interacting with the data sources
- D. The 'background_tasks' table to monitor the performance of scheduled tasks related to data sources

Answer: A

Explanation:

The 'data_connections' table to gain insights into connections and performance of published data sources The 'data_connections' table in the Tableau repository schema is critical for tracking the performance of published data sources. It provides detailed information on each connection made to the data sources, offering insights into how these data sources are being accessed and utilized, which is crucial for understanding and optimizing their performance. Option A is incorrect because the 'users' table, while identifying users, does not provide specific information on data source performance. Option C is incorrect as the 'background_tasks' table focuses on scheduled tasks and does not offer detailed insights into real-time data source performance. Option D is incorrect because the 'server_usage' table provides a broad overview of server activity but does not offer the granular details required for monitoring specific data source performance.

NEW QUESTION # 118

.....

You must want to receive our Analytics-Arch-201 practice questions at the first time after payment. Don't worry. As long as you finish your payment, our online workers will handle your orders of the Analytics-Arch-201 study materials quickly. The whole payment process lasts a few seconds. And if you haven't received our Analytics-Arch-201 Exam Braindumps in time or there are some trouble in opening or downloading the file, you can contact us right away, and our technicals will help you solve it in the first time.
