## EMC Dell PowerFlex Operate Exam Sample Questions (Q77-Q82):

### NEW QUESTION # 77

Which specific operations can be performed on PowerFlex volumes? (Choose two)

- A. Configure VLAN tagging directly on the volume
- B. Assign volumes to Protection Domains
- C. Enable data replication
- D. Create snapshots

Answer: C,D

Explanation:

PowerFlex Volumes are block-level storage devices mapped to hosts.

\* Create Snapshots (Option A): Snapshots are point-in-time copies of a volume. In PowerFlex, snapshots are writable and instantaneous. They share the same data blocks as the source volume until changes are made (Redirect-on-Write). They are essential for backups, testing/dev environments, and creating clones.

\* Enable Data Replication (Option D): PowerFlex supports native asynchronous and synchronous replication. This is configured at the Volume level (or via Consistency Groups containing volumes).

You select a volume and pair it with a destination volume on a remote PowerFlex cluster to ensure disaster recovery.

Incorrect Options:

\* VLAN tagging (B): This is a network configuration performed at the OS/Switch/Interface level, not on a storage block volume.

\* Assign to PD (C): Volumes reside inside a Storage Pool, which resides inside a Protection Domain.

You assign a volume to a Storage Pool upon creation, not directly to a Protection Domain.

### NEW QUESTION # 78

What is the default state of snapshots created in PowerFlex?

- A. Archived
- B. Active
- C. Read-only
- D. Editable

**Answer: D**

Explanation:

\* Editable (Writable): Unlike many traditional storage arrays where a snapshot is a read-only frozen image requiring a "clone" to become writable, PowerFlex snapshots are fully writable volumes by default.

\* Behavior: Immediately upon creation, a snapshot is mapped as a volume. You can mount it to a host, write new data to it, delete files from it, or format it, without affecting the source parent volume (due to the Redirect-on-Write architecture).

### NEW QUESTION # 79

What is the minimum number of nodes required for creating a Fault Set in PowerFlex?

- A. 0
- B. 1
- C. 2
- D. 3

**Answer: C**

Explanation:

\* 6 Nodes: To utilize the Fault Set feature (which provides higher availability than standard SDS grouping, typically for rack awareness), PowerFlex requires a minimum configuration.

\* The Math:

\* A Protection Domain requires a minimum of 3 Fault Sets to support the 2-copy mirroring (Primary, Secondary, and a third location for rebuilding if a set fails).

\* Dell PowerFlex engineering requirements state that each Fault Set must contain at least 2 SDS nodes to ensure local redundancy and performance balance within the set.

\*  $3 \text{ Fault Sets} \times 2 \text{ Nodes} = 6 \text{ Nodes}$  minimum.

### NEW QUESTION # 80

An administrator is preparing to upgrade a PowerFlex cluster. What steps should they follow to ensure success? (Choose two).

- A. Verify the cluster health status in PowerFlex Manager
- B. Backup the current cluster configuration
- C. Validate hardware compatibility for all nodes
- D. Enable deduplication for all volumes

**Answer: A,B**

Explanation:

A successful upgrade relies on a stable starting state and a recovery plan.

\* Verify the cluster health status (Option D): This is the most critical pre-requisite. You must check the PowerFlex Manager dashboard or use the CLI (scli --query\_cluster) to ensure the system state is "Optimal." You cannot proceed with an upgrade if the system is in a "Degraded" state or if a Rebuild /Rebalance is currently active, as taking a node offline for upgrade could lead to data unavailability.

\* Backup the current cluster configuration (Option A): In the rare event of a catastrophic failure during the upgrade (e.g., MDM database corruption), having a recent backup of the MDM configuration allows you to restore the cluster map and volume definitions.

### NEW QUESTION # 81

Shared file systems in PowerFlex allow data sharing across multiple nodes. True or False?

- A. False
- B. True

**Answer: B**

Explanation:

This refers to PowerFlex File (formerly PowerFlex NAS).

While the core PowerFlex product is a block storage solution (providing raw LUNs/Volumes which cannot be safely shared by two standard OS hosts without a cluster file system like VMFS or OCFS2), PowerFlex File introduces NAS nodes. These nodes format the block storage and present it via NFS or SMB protocols. These protocols are specifically designed to allow multiple clients to read and write to the same file system concurrently, enabling true data sharing across the network.
