

Quiz Microsoft - Valid PL-300 - Microsoft Power BI Data Analyst Examcollection Dumps Torrent

DOWNLOAD the newest ExamsLabs PL-300 PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1R80TfbHnqodJtq0P-yySyneOW05XC0TC>

The "ExamsLabs" is one of the top-rated and reliable platforms that offer real, valid, and updated Microsoft Power BI Data Analyst (PL-300) exam questions in three different formats. The names of these formats are ExamsLabs PL-300 PDF dumps file, desktop practice test software, and web-based practice test software. All these three ExamsLabs PL-300 Exam Questions formats are easy to use and perfectly work with desktop computers, laptops, tabs, or even on your smartphone devices.

Understanding Microsoft Power BI Data Analyst Certification Exam Topics

Microsoft Power BI Data Analyst Certification Exam Topics are below:

- Prepare the data (15-20%)
- Visualize and analyze the data (25-30%)
- Deploy and maintain assets (20-25%)
- Model the data (30-35%)

Reliable PL-300 Dumps Questions, PL-300 Certified

Our PL-300 study materials are closely linked with the test and the popular trend among the industries and provide all the information about the test. The answers and questions seize the vital points and are verified by the industry experts. Diversified functions can help you get an all-around preparation for the test. Our online customer service replies the clients' questions about our PL-300 Study Materials at any time. So our PL-300 study materials can be called perfect in all aspects.

Microsoft PL-300 Certification Exam consists of various topics, including understanding business requirements, creating data models, visualizing data with Power BI, and collaborating and sharing Power BI content. To be eligible for this certification, candidates must have a fundamental understanding of data analysis, data modeling, and data visualization. Additionally, candidates should be familiar with the Power BI service, including its various features and capabilities.

Microsoft Power BI Data Analyst Sample Questions (Q222-Q227):

NEW QUESTION # 222

Hotspot Question

You have a semantic model named Model1 that contains a table named Table1.

Table1 contains three columns named CustomerID, Age, and LoyaltyStatus.

You have an order system that tracks the order history of each customer.

You need to import the order system data into Model1 and create a single table that combines LoyaltyStatus with the number of orders. The solution must ensure that only customers that have orders are stored in the dataset.

How should you create the table, and which join kind should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

Box 1: Merging the queries

To achieve this in Power BI, we will use the Power Query Editor to merge your existing semantic model table with the new data from your order system. This approach ensures your data is cleaned and transformed before it hits the report layer.

Box 2: Inner

To create a new table in Power BI (using Power Query) that combines customer loyalty status with order data, specifically ensuring only customers with at least one order are included, you should use an Inner Join.

Inner Join (or "Only matching rows" in Power Query) returns rows only when there is a match in both the left (Customer Table) and right (Order System) tables.

If a customer exists in the customer table but has no orders, they will be excluded.

NEW QUESTION # 223

You are preparing a financial report in Power BI.

You connect to the data stored in a Microsoft Excel spreadsheet by using Power Query Editor as shown in the following exhibit.

You need to prepare the data to support the following:

* Visualizations that include all measures in the data over time

* Year-over-year calculations for all the measures

Which four actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Answer:

Explanation:

Explanation:

1. Use first row as header

2. Unpivot all columns other than "Measure"

3. Rename "Attribute" to "Year"

4. Change data type of "Year" to date (Date > Year)

NEW QUESTION # 224

You have a Power BI data model that contains two tables named Products and Sales.

A one-to-many relationship exists between the tables.

You have a report that contains a report-level filter for Products.

You need to create a measure that will return the percent of total sales for each product. The measure must respect the report-level filter when calculating the total.

How should you complete the DAX measure? To answer drag the appropriate DAX functions to the correct targets- Each function may be used once, more than once, or not at all the spirit bar between panes or scroll to view content NOTE: Each correct selection is worth one point

Answer:

Explanation:

Explanation

NEW QUESTION # 225

You build a report about warehouse inventory data.

a. The dataset has more than 10 million product records from 200 warehouses worldwide. You have a table named Products that contains the columns shown in the following table.

Warehouse managers report that it is difficult to use the report because the report uses only the product name in tables and visuals. The product name is contained within the ProductDescription column and is always the fourth value.

You need to modify the report to support the warehouse managers requirement to explore inventory levels at different levels of the product hierarchy. The solution must minimize the model size.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Answer:

Explanation:

- 1 - Add a column named ProductName that,
- 2 - Create a product hierarchy of ProductCategory,
- 3 - Replace the use of ProductDescription in the report with the product hierarchy

NEW QUESTION # 226

Case Study 3 - Northwind Traders

Overview. General Overview

Northwind Traders is a specialty food import company.

The company recently implemented Power BI to better understand its top customers, products, and suppliers.

Overview. Business Issues

The sales department relies on the IT department to generate reports in Microsoft SQL Server Reporting Services (SSRS). The IT department takes too long to generate the reports and often misunderstands the report requirements.

Existing Environment. Data Sources

Northwind Traders uses the data sources shown in the following table.

Source2 is exported daily from a third-party system and stored in Microsoft SharePoint Online.

Existing Environment. Customer Worksheet

Source2 contains a single worksheet named Customer Details. The first 11 rows of the worksheet are shown in the following table.

All the fields in Source2 are mandatory.

The Address column in Customer Details is the billing address, which can differ from the shipping address.

Existing Environment. Azure SQL Database

Source1 contains the following table:

Orders

Products

Suppliers

Categories

Order Details

Sales Employees

The Orders table contains the following columns.

The Order Details table contains the following columns.

The address in the Orders table is the shipping address, which can differ from the billing address.

The Products table contains the following columns.

The Categories table contains the following columns.

The Suppliers table contains the following columns.

The Sales Employees table contains the following columns.

Each employee in the Sales Employees table is assigned to one sales region. Multiple employees can be assigned to each region.

Requirements. Report Requirements

Northwind Traders requires the following reports:

Top Products

Top Customers

On-Time Shipping

The Top Customers report will show the top 20 customers based on the highest sales amounts in a selected order month or quarter, product category, and sales region.

The Top Products report will show the top 20 products based on the highest sales amounts sold in a selected order month or quarter, sales region, and product category. The report must also show which suppliers provide the top products.

The On-Time Shipping report will show the following metrics for a selected shipping month or quarter:
 The percentage of orders that were shipped late by country and shipping region
 Customers that had multiple late shipments during the last quarter
 Northwind Traders defines late orders as those shipped after the required shipping date.
 The warehouse shipping department must be notified if the percentage of late orders within the current month exceeds 5%.
 The reports must show historical data for the current calendar year and the last three calendar years.

Requirements. Technical Requirements
 Northwind Traders identifies the following technical requirements:
 A single dataset must support all three reports.
 The reports must be stored in a single Power BI workspace.
 Report data must be current as of 7 AM Pacific Time each day.
 The reports must provide fast response times when users interact with a visualization.
 The data model must minimize the size of the dataset as much as possible, while meeting the report requirements and the technical requirements.

Requirements. Security Requirements
 Access to the reports must be granted to Azure Active Directory (Azure AD) security groups only.
 An Azure AD security group exists for each department.
 The sales department must be able to perform the following tasks in Power BI:
 Create, edit, and delete content in the reports.
 Manage permissions for workspaces, datasets, and report.
 Publish, unpublish, update, and change the permissions for an app.
 Assign Azure AD groups role-based access to the reports workspace.
 Users in the sales department must be able to access only the data of the sales region to which they are assigned in the Sales Employees table.
 Power BI has the following row-level security (RLS) Table filter DAX expression for the Sales Employees table.
 [EmailAddress] = USERNAME()
 RLS will be applied only to the sales department users. Users in all other departments must be able to view all the data.
 You need to create the dataset. Which dataset mode should you use?

- A. Import
- B. DirectQuery
- C. Composite
- D. Live connection

Answer: C

Explanation:

Composite Model means now you can have a model, that very large tables of that are coming from the DirectQuery connection, without the need for importing, and small tables to be imported to be accessible quickly.
 In this case, Composite fits perfect. Source1 is 2GB, which is relatively too large for daily updates and way larger than Source2 which is only 5MB.
