UiPath Certified Professional Automation Business Analyst Professional v1.0 Sample Questions (Q79-Q84):

NEW QUESTION # 79

In the context of UiPath selectors, what is an anchor?

- A. An XML fragment that stores the attributes of an element and its parent elements, including the target application
- **B. An anchor is a nearby element that helps to uniquely identify the target element.**
- C. A selector that takes into account possible changes in the attributes of an element, identifying them based on a pattern, rather than on an exact match
- D. An image in the application window that identifies the element, for example an icon or a button

Answer: B

Explanation:

In UiPath, an anchor is used in conjunction with selectors to improve the accuracy of identifying UI elements within an application.

When a selector is not reliable due to dynamic content or changing layouts, an anchor- a stable element nearby the target-can be used to pinpoint the target element with greater precision. The anchor serves as a point of reference, and the relative position of the target element to this anchor is used to identify it during automation tasks¹.

References: The explanation is based on the UiPath Documentation Portal's definition of anchors in the context of selectors²¹.

NEW QUESTION # 80

How can UiPath Communications Mining help organizations improve their customer service?

- **A. By analyzing customer interactions and providing insights and recommendations**
- B. By securely storing customer data and making it accessible to customer service agents
- C. By providing tools for managing customer relationships and interactions
- D. By automating customer service tasks and allowing agents to handle more requests

Answer: A

Explanation:

UiPath Communications Mining analyzes unstructured customer conversations (e.g., emails, tickets, feedback) and extracts actionable insights. These insights help organizations:

- * Understand customer sentiment and concerns
- * Identify trends and topics for improvement
- * Prioritize responses and streamline workflows

"UiPath Communications Mining enables businesses to analyze short-form asynchronous communications, identify patterns and trends, and provide actionable insights to improve customer service." References:

NEW QUESTION # 81

What is a process in the context of an automation implementation using UiPath?

- A. A group of related processes that share common goals and objectives
- **B. An enumeration of steps that can be grouped into subprocesses and tasks**
- C. A high-level representation of the organization's business processes and their relationships
- D. An action that is performed by a software robot

Answer: B

Explanation:

In the context of an automation implementation using UiPath, a process is defined as an enumeration of steps that can be grouped into subprocesses and tasks. This definition aligns with the concept of Robotic Process Automation (RPA), where a process is a sequence of tasks that are performed to achieve a specific outcome. In UiPath, these tasks are automated using software robots that emulate human actions to carry out the defined steps¹.

NEW QUESTION # 82

Which of the following is considered a Thin Client?

- A. Desktop Applications
- **B. VDI / Remote Desktops**
- C. Terminal Emulator
- D. Webpages / Web Applications

Answer: B

Explanation:

In the context of UiPath, a Thin Client refers to an application that is accessed over a network such as a web application or a remote desktop. It is typically a browser-based interface or a virtual desktop infrastructure (VDI) like Remote Desktops. Thin clients do not run the application locally; instead, they rely on a server to process the application tasks. This contrasts with Thick Clients, which are applications installed locally on a machine where UiPath can directly interact with the elements of the application¹.

References: The explanation is based on the UiPath Community Forum discussions and the UiPath Documentation Portal's

information on thin client automation1.

NEW QUESTION # 83

What event can affect selector reliability in automations?

- A. An update to the UiPath Robot running the automation
- **B. Automation target applications being updated**
- C. An increase in the volume of transactions
- D. Target applications changing their position on the screen

Answer: B

Explanation:

An event that can affect selector reliability in automations is the target applications being updated. Updates to applications can alter the UI elements and structures that selectors depend on, leading to failures in identifying these elements during automation execution.
