CompTIA Security+ Certification Exam Sample Questions (Q770-Q775):

NEW QUESTION # 770

A company is considering an expansion of access controls for an application that contractors and internal employees use to reduce costs. Which of the following risk elements should the implementation team understand before granting access to the application?

- A. Threshold
- B. Tolerance
- C. Register
- D. Appetite

Answer: B

NEW QUESTION # 771

Which of the following is a benefit of launching a bug bounty program? (Choose two.)

- A. Quicker discovery of vulnerabilities
- B. Reduction in the number of zero-day vulnerabilities
- C. Increased security awareness for the workforce
- D. Improved patch management process
- E. Reduced cost of managing the program
- F. Improved reputation for the organization

Answer: A,F

Explanation:

A bug bounty program can improve an organization's reputation by demonstrating a proactive approach to security.

It enables quicker discovery of vulnerabilities by leveraging external researchers to identify issues faster than internal teams alone.

NEW QUESTION # 772

A spoofed identity was detected for a digital certificate. Which of the following are the type of unidentified key and the certificate that could be in use on the company domain?

- A. Public key and wildcard certificate
- **B. Private key and self-signed certificate**
- C. Public key and expired certificate
- D. Private key and root certificate

Answer: B

Explanation:

A self-signed certificate is a certificate that is signed by its own private key rather than by a trusted certificate authority (CA). This means that the authenticity of the certificate relies solely on the issuer's own authority. If a spoofed identity was detected, it could indicate that a private key associated with a self-signed certificate was compromised. Self-signed certificates are often used internally within organizations, but they carry higher risks since they are not validated by a third-party CA, making them more susceptible to spoofing.

NEW QUESTION # 773

Which of the following should a company use to provide proof of external network security testing?

- A. Vulnerability assessment
- B. Business impact analysis
- **C. Third-party attestation**
- D. Supply chain analysis

Answer: C

Explanation:

Detailed Third-party attestation involves an external, independent party performing a network security assessment and providing documented proof, ensuring objectivity and compliance with regulatory or client requirements.
