CrowdStrike Certified Cloud Specialist Sample Questions (Q205-Q210):

NEW QUESTION # 205
During a routine audit, you discover that multiple endpoints in your CrowdStrike Falcon inventory are missing critical metadata, such as hostname and operating system details. What is the most effective way to resolve this issue and maintain an accurate asset inventory?

- A. Ignore the issue, as the devices will update themselves automatically over time.
- B. Remove the endpoints from the inventory to prevent confusion.
- C. Deploy the Falcon sensor on the affected endpoints to collect detailed telemetry.
- D. Reassign the endpoints to a different group within the platform.

Answer: C

Explanation:
Option A: The Falcon sensor provides detailed telemetry, including metadata such as hostname, operating system, and other critical details. Deploying the sensor ensures the inventory is accurate and up-to-date, enabling effective monitoring and management.
Option B: Removing endpoints creates blind spots in the inventory and security monitoring.
Properly identifying and managing them is critical for maintaining security posture.
Option C: Relying on automatic updates without addressing the root cause may leave critical gaps in asset visibility and management.
Proactive action is necessary.
Option D: Reassigning the endpoints does not resolve the underlying issue of missing metadata.
The problem requires deploying the sensor to collect accurate data.

NEW QUESTION # 206
You are setting up CrowdStrike to assess images in your container registry. What is the first step to establish a connection for image scanning?

- A. Configure an API key in the CrowdStrike Falcon console and provide it to the image registry.
- B. Enable automatic image scanning in the image registry without additional configuration.
- C. Enable CrowdStrike image scanning through the cloud provider's default security settings.
- D. Register the image registry's credentials in the CrowdStrike Falcon console.

Answer: D

Explanation:
Option A: Cloud provider default settings don't automatically support CrowdStrike integration. You need to explicitly configure and register the registry with CrowdStrike.
Option B: While API keys may be used for other integrations, the process of registering a connection involves providing the registry's credentials to CrowdStrike, not the other way around.
Option C: Automatic image scanning by the registry itself doesn't integrate with CrowdStrike. You must explicitly connect the registry to CrowdStrike for its scanning capabilities to be utilized.
Option D: To establish a connection for image scanning, you need to register the image registry in the CrowdStrike Falcon console. This involves providing the registry's credentials and configuration details, enabling CrowdStrike to access and scan images securely. This step establishes trust and ensures compatibility between the registry and CrowdStrike.

NEW QUESTION # 207
Which of the following is a correct example of using automated remediation in the CrowdStrike Falcon platform to address a cloud-related security incident?

- A. Disabling unused user accounts in the cloud environment weekly
- B. Notifying an administrator to review suspicious activity manually
- C. Quarantining a compromised virtual machine automatically upon detection of malware
- D. Sending compliance violation logs to a third-party monitoring system

Answer: C

Explanation:
Option A: This action is an example of a maintenance task, not automated remediation.
Automated remediation focuses on dynamic responses to detected threats or incidents rather than routine administrative tasks.
Option B: This action is part of logging and monitoring, not remediation. Automated remediation involves direct actions to mitigate or eliminate threats rather than just reporting or logging violations.
Option C: Automated remediation in the CrowdStrike Falcon platform includes the ability to isolate or quarantine compromised resources, such as virtual machines, to prevent further spread of malware or threats. This action happens automatically based on predefined policies and is a hallmark of automated remediation. It ensures immediate containment without waiting for manual intervention.
Option D: While notification is an essential part of incident response, it is not an example of automated remediation. Automated remediation involves taking direct action, such as isolating or removing a threat, rather than relying on manual review or follow-up.

NEW QUESTION # 208
What is the primary benefit of using automated remediation in CrowdStrike's cloud security ecosystem?

- A. Reduces response times to security incidents by executing predefined actions.
- B. Provides detailed vulnerability reports to the management team.
- C. Eliminates the need for security analysts to monitor alerts.
- D. Ensures 100% prevention of all security breaches.

Answer: A

Explanation:
Option A: Automated remediation is designed to execute predefined actions--such as isolating a compromised endpoint or revoking access privileges--immediately upon detecting a threat, significantly reducing response time.
Option B: Automated remediation executes actions rather than generating vulnerability reports.
Reporting is handled by other CrowdStrike tools or dashboards.
Option C: Automated remediation complements human oversight but does not eliminate the need for monitoring. Analysts still play a crucial role in investigating complex or ambiguous threats.
Option D: Automated remediation reduces risk and speeds up response but cannot guarantee complete prevention of breaches. No security solution offers absolute protection.

NEW QUESTION # 209
In the context of Falcon Cloud Security, what is the primary difference between managed/unmanaged items (e.g., accounts or containers) and assessed/unassessed items (e.g., container images)?

- A. Managed items are accounts or containers actively monitored by Falcon Cloud Security, whereas unmanaged items are accounts or containers not yet under CrowdStrike monitoring.
- B. Assessed items are container images that have been scanned and evaluated for vulnerabilities, while unassessed items are container images awaiting assessment.
- C. Assessed items are accounts or containers with detected vulnerabilities, while unassessed items are accounts or containers with unknown vulnerabilities.
- D. Managed items refer to container images with vulnerabilities actively managed by CrowdStrike, while unmanaged items are container images that are no longer in use.

Answer: A

Explanation:
Option A: Assessed/unassessed items relate to whether vulnerability assessment has occurred.
This choice incorrectly describes their scope and misapplies the terminology to accounts or containers instead of container images.
Option B: Managed/unmanaged items do not refer to container images specifically. This conflates the concept of container images (assessed/unassessed) with managed/unmanaged accounts or containers. The status of being managed/unmanaged pertains to whether the item is actively monitored, not the vulnerability state.
Option C: Managed items are accounts or containers actively integrated with and monitored by Falcon Cloud Security. Unmanaged items are those outside the scope of Falcon monitoring, often requiring additional steps to bring them under management. This distinction is fundamental to understanding CrowdStrike's coverage capabilities.
Option D: This explanation accurately describes assessed/unassessed items, not managed/unmanaged items. The former pertains to

whether a container image has been scanned for vulnerabilities.
