P.S. Free 2026 CWNP CWSP-208 dumps are available on Google Drive shared by ITPassLeader: <https://drive.google.com/open?id=1DRcu-98HGpk9t06DlfUdoVIFdDQdJdG>

With the help of the CWSP-208 practice exam questions and preparation material offered by ITPassLeader, you can pass any CWSP-208 certifications exam in the first attempt. You don't have to face any trouble, and you can simply choose to do a selective CWSP-208 brain dumps to pass the exam. We offer guaranteed success with CWSP-208 Questions on the first attempt, and you will be able to pass the CWSP-208 exam in short time. You can always consult our CWSP-208 certified professional support if you are facing any problems.

It is known to us that time is money, and all people hope that they can spend less time on the pass. We are happy to tell you that The Certified Wireless Security Professional (CWSP) exam questions from our company will help you save time. With meticulous care design, our study materials will help all customers pass their exam in a shortest time. If you buy the CWSP-208 Study Materials from our company, you just need to spend less than 30 hours on preparing for your exam, and then you can start to take the exam. We believe that you will pass your exam and get the related certification with CWSP-208 study dump.

## Latest Test CWSP-208 Discount | CWSP-208 Cert

Every CWNP aspirant wants to pass the CWNP CWSP-208 exam to achieve high-paying jobs and promotions. The biggest issue Certified Wireless Security Professional (CWSP) (CWSP-208) exam applicants face is that they don't find credible platforms to buy Real CWSP-208 Exam Dumps. When candidates don't locate actual Certified Wireless Security Professional (CWSP) (CWSP-

208) exam questions they prepare from outdated material and ultimately lose resources.

## CWNP Certified Wireless Security Professional (CWSP) Sample Questions (Q71-Q76):

### NEW QUESTION # 71

Given: ABC Company has a WLAN controller using WPA2-Enterprise with PEAPv0/MS-CHAPv2 and AES-CCMP to secure their corporate wireless data. They wish to implement a guest WLAN for guest users to have Internet access, but want to implement some security controls. The security requirements for the hot-spot include:

- \* Cannot access corporate network resources
- \* Network permissions are limited to Internet access
- \* All stations must be authenticated

What security controls would you suggest? (Choose the single best answer.)

- A. Use a WIPS to deauthenticate guest users when their station tries to associate with the corporate WLAN.
- **B. Require guest users to authenticate via a captive portal HTTPS login page and place the guest WLAN and the corporate WLAN on different VLANs.**
- C. Force all guest users to use a common VPN protocol to connect.
- D. Implement separate controllers for the corporate and guest WLANs.
- E. Configure access control lists (ACLs) on the guest WLAN to control data types and destinations.

**Answer: B**

Explanation:

This solution meets all the requirements:

Captive portals allow simple authentication for guest users.

VLAN separation enforces network segmentation.

HTTPS ensures authentication is encrypted.

Incorrect:

A). Separate controllers are unnecessary and costly.

B). WIPS enforcement is reactive, not proactive for normal access control.

C). ACLs alone don't enforce authentication.

E). VPN requirements would be overly complex for guests.

References:

CWSP-208 Study Guide, Chapter 6 (Guest Network Architecture & Captive Portal Authentication)

### NEW QUESTION # 72

What wireless security protocol provides mutual authentication without using an X.509 certificate?

- A. EAP-TTLS
- B. PEAPv0/EAP-MSCHAPv2
- **C. EAP-FAST**
- D. EAP-MD5
- E. EAP-TLS
- F. PEAPv1/EAP-GTC

**Answer: C**

Explanation:

EAP-FAST (Flexible Authentication via Secure Tunneling) provides:

Mutual authentication using Protected Access Credentials (PACs).

Does not require X.509 certificates for either client or server (although optional for servers).

Is faster and easier to deploy in environments lacking a PKI.

Incorrect:

B). EAP-MD5 provides no mutual authentication.

C). EAP-TLS requires client and server certificates.

D). PEAPv0/EAP-MSCHAPv2 requires a server certificate.

E). EAP-TTLS requires a server certificate.

F). PEAPv1/EAP-GTC still requires a server certificate.

### NEW QUESTION # 73

In an effort to optimize WLAN performance, ABC Company has upgraded their WLAN infrastructure from 802.11a/g to 802.11n. 802.11a/g clients are still supported and are used throughout ABC's facility. ABC has always been highly security conscious, but due to budget limitations, they have not yet updated their overlay WIPS solution to 802.11n or 802.11ac. Given ABC's deployment strategy, what security risks would not be detected by the 802.11a/g WIPS?

- A. 802.11a STA performing a deauthentication attack against 802.11n APs
- B. 802.11n client spoofing the MAC address of an authorized 802.11n client
- C. Hijacking attack performed by using a rogue 802.11n AP against an 802.11a client
- **D. Rogue AP operating in Greenfield 40 MHz-only mode**

**Answer: D**

Explanation:

An 802.11a/g-based WIPS cannot detect rogue activity that occurs in 802.11n/ac-specific modes, including Greenfield (HT-only) operation and use of 40 MHz channels, which are not part of the 802.11a/g specification. Greenfield mode disables legacy support, so a WIPS limited to 802.11a/g radios won't even

"see" these frames. This leaves a significant blind spot for detecting certain types of rogue devices or attacks using newer PHYs.

CWNP CWSP-208 Objectives: "Protocol Compatibility and Threat Detection"

### NEW QUESTION # 74

After completing the installation of a new overlay WIPS for the purpose of rogue detection and security monitoring at your corporate headquarters, what baseline function **MUST** be performed in order to identify security threats?

- A. Upstream and downstream throughput thresholds must be specified to ensure that service-level agreements are being met.
- B. Separate security profiles must be defined for network operation in different regulatory domains
- C. Authorized PEAP usernames must be added to the WIPS server's user database.
- **D. WLAN devices that are discovered must be classified (rogue, authorized, neighbor, etc.) and a WLAN policy must define how to classify new devices.**

**Answer: D**

Explanation:

After deploying a WIPS, an essential baseline activity is to classify all detected devices in the RF environment. These classifications allow the system to enforce security policies and detect policy violations.

Classifications include:

Authorized (managed devices)

Rogue (unauthorized, possibly dangerous)

Neighbor (not part of your network but legitimate)

External or Ad hoc devices

Without this initial classification, WIPS cannot properly assess threats or trigger alarms.

CWSP-208 Study Guide, Chapter 7 - WIPS Classification and Threat Management CWNP CWSP-208 Objectives: "Device Classification and Policy Enforcement"

### NEW QUESTION # 75

What drawbacks initially prevented the widespread acceptance and use of Opportunistic Key Caching (OKC)?

- A. Sharing cached keys between controllers during inter-controller roaming created vulnerabilities that exposed the keys to attackers.
- B. The Wi-Fi Alliance continually delayed the creation of a client certification for OKC, even though it was defined by IEEE

802.11r.

- C. Key exchanges during fast roams required processor-intensive cryptography, which was prohibitive for legacy devices supporting only TKIP.
- D. Because OKC is not defined by any standards or certification body, client support was delayed and sporadic early on.

**Answer: D**

Explanation:

Opportunistic Key Caching (OKC) is a non-standardized fast roaming method that allows clients to roam between APs without repeating the full 802.1X/EAP authentication process.

OKC was proposed by vendors (not the IEEE or Wi-Fi Alliance), so there was no formal certification early on.

This led to inconsistent and delayed client support, preventing widespread adoption.

Incorrect:

A). OKC does not involve inter-controller roaming in most scenarios; it's a local caching method.

C). The cryptographic overhead was not a significant barrier compared to lack of standardization.

D). OKC was not defined in IEEE 802.11r-Fast BSS Transition (FT) was.
