NSE6_EDR_AD-7.0日本語版参考書 & NSE6_EDR_AD-7.0問題集無料

人生には様々な選択があります。選択は必ずしも絶対的な幸福をもたらさないかもしれませんが、あなたに変化のチャンスを与えます。MogiExamのFortinetのNSE6_EDR_AD-7.0「Fortinet NSE 6 - FortiEDR 7.0 Administrator」試験トレーニング資料はIT職員としてのあなたがIT試験に受かる不可欠なトレーニング資料です。MogiExamのFortinetのNSE6_EDR_AD-7.0試験トレーニング資料はカバー率が高くて、更新のスピードも速くて、完全なトレーニング資料ですから、MogiExamを手に入れたら、全てのIT認証が恐くなくなります。

Fortinet NSE 6 - FortiEDR 7.0 Administrator 認定 NSE6_EDR_AD-7.0 試験 問題 (Q22-Q27):

質問 # 22

Refer to the exhibit.

Based on the event shown in the exhibit, which two statements about the event are true? (Choose two answers)

- A. TestApplication.exe is sophisticated malware.

- B. FCS classified the event as malicious.
- C. The event is marked as Handled.
- D. The user was able to launch TestApplication.exe.

正解: B、D

解説:

The correct answers are B and C .

The exhibit shows the event classification as Malicious . In FortiEDR, event classification can be performed by the Core and later updated by FortiEDR Cloud Service (FCS) . The guide states that the audit history shows the classification chronology and includes details when FCS reclassifies a security event after the Core's initial classification. It also states that notifications can be based on either Core or FCS classification depending on whether FCS classification is received within the timeout period.

The exhibit also shows TestApplication.exe with Status: Running . That means the process was launched and is currently running on the endpoint. Therefore, C is correct.

Option A is wrong because the exhibit clearly shows Status: Unhandled , not Handled. The guide states that FortiEDR security events are initially marked as unread and unhandled, and users can later mark them handled through the incident handling workflow.

Option D is wrong because the exhibit shows rule indicators such as Invalid Checksum , Suspicious Packer , and Writable Code , but it does not prove that TestApplication.exe is "sophisticated malware." FortiEDR classifies the event as malicious, but the guide's Malicious classification means the event is verified to have malicious capability, is intended to harm the infected device, and has no commercially viable use; the exhibit alone does not justify the stronger claim "sophisticated malware."

質問 # 23

Refer to the exhibit:

Process exclusion

You configured an execution prevention exclusion with both File Name = app.exe and Path = C:\Tools. What will FortiEDR do? (Choose one answer)

- A. Exclude only signed versions of app.exe.
- B. Exclude only app.exe when it is running from C:\Tools.
- C. Exclude app.exe whenever it appears.
- D. Exclude all files in C:\Tools.

正解: B

解説:

The correct answer is B. Exclude only app.exe when it is running from C:\Tools.

The FortiEDR 7.0.0 Administration Guide explains that the Exclusion Manager is used to define which processes, files, or domains are excluded from Security Policies monitoring. For Process Exclusions, FortiEDR does not inspect actions performed by specific processes, and those processes are identified by the attributes defined by the administrator.

The guide further explains that process/source attributes can include File Name, Path, Hash, and Signer. It also states that when an exclusion contains multiple conditions, an AND relationship exists between the conditions. If an OR relationship is required, a separate exclusion must be created.

In this exhibit, both conditions are selected:

File Name = app.exe

Path = C:\Tools

Because FortiEDR applies an AND relationship between multiple exclusion conditions, the exclusion applies only when both conditions match. Therefore, FortiEDR excludes app.exe only when it is located/running from C:\Tools.

Option A is wrong because no Signer condition is selected. Option C is wrong because that would apply if only the file name were used broadly. Option D is wrong because FortiEDR is not excluding every file in C:\Tools; it is excluding the process that matches both the file name and path conditions.

質問 # 24

You are asked to configure a query to run every 15 minutes, automatically searching for specific registry modifications across all endpoints. Which FortiEDR feature must you configure? (Choose one answer)

- A. A manual query linked to a policy override
- B. A communication control rule with a 15-minute delay
- C. A new playbook trigger based on the registry change event
- **D. A scheduled query defined within a threat hunting profile**

正解: D

解説:

The correct answer is C.

The FortiEDR guide explains that Threat Hunting searches across endpoint activity events, including registry activity. It states that Threat Hunting can search based on attributes of files, registry keys and values, network, processes, event log, and activity event types. This fits the requirement to search for specific registry modifications across endpoints.

The guide also explains that after filtering activity events, the query can be saved and defined as a Scheduled Query. It says:

"Scheduled Query: Mark this option to automate the process of detecting threats so that this query is run automatically according to the schedule that you define." It also states that a security event is automatically created in the Incidents tab when matches are detected, and notifications can be sent through email, Syslog, and other configured methods.

The guide further states that the Repeat Every/On options define the frequency and schedule when the query runs. Therefore, a 15-minute recurring query is handled through the Scheduled Query capability in Threat Hunting, not Communication Control, policy override, or a manual Playbook trigger.

Strictly speaking, the guide calls this a scheduled query under Threat Hunting saved queries, not a "communication control rule" or "manual query." Option C is the intended answer.

質問 # 25

Within the FortiEDR architecture, which component needs JumpBox capabilities to enable authenticated and controlled communication with FortiAnalyzer? (Choose one answer)

- **A. Core**
- B. Aggregator
- C. Central manager
- D. Reputation Server

正解: A

解説:

The correct answer is A. Core.

For FortiAnalyzer / FortiAnalyzer Cloud integration, the FortiEDR 7.0.0 Administration Guide states that one prerequisite is "A Jumpbox with connectivity to FortiAnalyzer." The same section says to refer to Setting up the FortiEDR Core for details about installing a FortiEDR Core and configuring it as a Jumpbox. In the connector configuration, the guide also states that the Jumpbox field is used to select the FortiEDR Jumpbox that will communicate with FortiAnalyzer or FortiAnalyzer Cloud.

So, the FortiEDR component associated with JumpBox capability is the Core. The Central Manager must have connectivity to Fortinet Cloud Services, but it is not the component configured as the JumpBox. The Aggregator handles registration, configuration, and monitoring between Collectors/Cores and Central Manager, and the Reputation Server is unrelated to FortiAnalyzer JumpBox communication in this context.

質問 # 26

Which two statements correctly describe the IoT probing process on FortiEDR? (Choose two answers)

- A. It identifies nearby devices by retrieving details such as hostname and IP address.
- B. Collectors running on servers are always used for IoT probing.
- C. It captures all traffic from neighboring devices for deep packet inspection.
- D. Only healthy collectors participate in IoT probing.

正解: A、D

解説:

The correct answers are B and C .

The FortiEDR 7.0.0 Administration Guide explains that IoT device discovery continuously identifies newly connected non-workstation devices, such as printers, cameras, and media devices. During discovery, each relevant Collector periodically probes nearby neighboring devices. The guide states that nearby devices usually respond by providing information about themselves, including the device/host name and IP address .

This directly supports option B .

Option C is also correct because the guide states that Collectors in degraded , disabled , or isolated states do not take part in the IoT probing process. It also says FortiEDR uses the most powerful Collectors in each subnet and excludes weaker Collectors, including disabled and degraded Collectors.

Option A is wrong because the guide explicitly says Collectors running on servers do not take part in IoT probing. Option D is wrong because IoT probing is not described as deep packet inspection of all neighboring traffic; it is a discovery/probing process used to identify nearby devices and collect basic device information.

質問 # 27

.....

MogiExam有効なNSE6_EDR_AD-7.0研究急流がなければ、Fortinetあなたの利益はあなたの努力に比例しないといつも感じていませんか？ あなたは常に先延ばしに苦しみ、散発的な時間を十分に活用できないと感じていますか？ 答えが完全に「はい」の場合は、高品質で効率的なテストツールであるNSE6_EDR_AD-7.0トレーニング資料を試してみることをお勧めします。NSE6_EDR_AD-7.0試験に合格し、夢のあるNSE6_EDR_AD-7.0のFortinet NSE6 - FortiEDR 7.0 Administrator認定を取得することで、あなたの成功は100%保証され、より高い収入やより良い企業により多くの機会を得ることができます。
