## ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q400-Q405):

### NEW QUESTION # 400

Which of the following is the main benefit of a configuration management of testware?

- A. All testware is backed up with restore option, including incident reports and change requests.
- B. The testware can be traced to information in requirements tools and to the bug tracking system.
- C. There is an easy way to assess the level to test coverage provided by the existing tests
- D. All testware items are identified, version controlled, tracked for changes with relation to each other

Answer: D

Explanation:

Configuration management of testware is a critical aspect of maintaining the integrity and traceability of test assets throughout the testing lifecycle. The main benefit of configuration management is to ensure that all testware items, such as test cases, test scripts, test data, and test results, are systematically identified, version controlled, and tracked for changes in relation to each other.

Option C accurately describes this benefit. By applying configuration management principles to testware, teams can manage changes to test assets efficiently, ensuring that the testware remains consistent, up-to-date, and aligned with the version of the software under test. This control mechanism facilitates the reproducibility of tests, enhances the reliability of testing activities, and supports traceability from requirements through to defects.

Options A, B, and D describe other aspects of test management and testing processes but do not capture the core benefit of configuration management of testware, which is centered on the systematic control and tracking of testware items.

#### NEW QUESTION # 401

Which of the following statements are true?

1. Early and frequent feedback helps to avoid requirements misunderstanding.
  2. Early feedback allows teams to do more with less.
  3. Early feedback allows the team to focus on the most important features.
  4. Early and frequent feedback clarifies customer feedback by applying static testing techniques
- Select the correct answer:

- A. 0
- B. 1
- C. 2
- D. 3

**Answer: A**

Explanation:

The statement "Early and frequent feedback helps to avoid requirements misunderstanding" is true. Early feedback from stakeholders, through reviews and other static testing techniques, helps clarify requirements and ensures that any misunderstandings are addressed promptly. This practice aligns with Agile principles and contributes to developing software that meets user needs more accurately.

#### NEW QUESTION # 402

Which test approach will best fit a new project, with little documentation and high probability for bugs?

- A. Regression testing
- B. Exploratory testing
- C. Metric based approach
- D. Requirements based testing

**Answer: B**

Explanation:

Exploratory testing is an approach to testing that emphasizes learning, test design and test execution at the same time. Exploratory testing relies on the tester's skills, creativity and intuition to explore the software under test and discover defects. Exploratory testing is suitable for a new project with little documentation and high probability for bugs, as it can help uncover unknown requirements, assumptions and risks. Exploratory testing is not requirements based testing, which is an approach to testing that derives test cases from documented requirements or specifications. Requirements based testing is not feasible for a new project with little documentation, as it requires clear and complete requirements to be available. Exploratory testing is not metric based approach, which is an approach to testing that uses quantitative measures to monitor and control the testing process and evaluate the quality of the software product. Metric based approach is not effective for a new project with high probability for bugs, as it may not capture all aspects of quality and may lead to false confidence or unrealistic expectations. Exploratory testing is not regression testing, which is an approach to testing that verifies that previously tested software still performs correctly after changes. Regression testing is not relevant for a new project with no previous versions or baselines. #### NEW QUESTION # 403

Which ONE of the following options explains a benefit of independent testing the BEST?

- A. Independent testers are likely to recognize different types of failures compared to developers.
- B. The testers can be isolated from the development team and thus avoid acquiring the same bias as the developers.
- C. Developers may lose a sense of responsibility for the quality of the product they develop.
- D. Independent testers may lack information regarding the test object.

**Answer: A**

Explanation:

Comprehensive and Detailed In-Depth Explanation:

Independent testers provide a fresh perspective and are more likely to identify failures that developers might overlook due to their familiarity with the software (C). Independent testing helps avoid cognitive biases, improves defect detection, and enhances the overall quality assurance process. While A and D touch on related concepts, they do not directly define the benefit as well as C does. Option B highlights a potential challenge rather than a benefit.

#### NEW QUESTION # 404

Which of the following is not an example of a typical content of a test completion report for a test project?

- A. The residual risk level if a risk-based test approach was adopted
- B. The unexpected test environment downtime that resulted in slower test execution
- C. The additional effort spent on test execution compared to what was planned
- D. The test procedures of all test cases that have been executed

**Answer: D**

Explanation:

This answer is correct because the test procedures of all test cases that have been executed are not a typical content of a test completion report for a test project. A test completion report is a document that summarizes the test activities and results at the end of a test project. It usually includes information such as the test objectives, scope, approach, resources, schedule, results, deviations, issues, risks, lessons learned, and recommendations for improvement. The test procedures of all test cases that have been executed are part of the test documentation, but they are not relevant for the test completion report, as they do not provide a high-level overview of the test project outcomes and performance.
