

# Effective Nutanix NCP-DB-6.10 Questions - Get Ready For The NCP-DB-6.10 Exam

Different age groups prefer different kinds of learning methods. In order to meet the requirements of all people, we have diversified our NCP-DB-6.10 exam questions to suit a wider range of lifestyles and tastes. At present, we have PDF version, online engine and software version. You can choose which NCP-DB-6.10 test guide version suits you best. Generally, young people are inclined to purchase online engine or software version because they like experiencing new things. Middle aged people are more likely to choose PDF version because they get used to learning the printed Nutanix Certified Professional - Database Automation (NCP-DB) v6.10 test questions. Of course, the combination use of different version of the NCP-DB-6.10 Test Guide is also a good choice. You can purchase according to your own tastes.

Mostly you waste a lot of time to fail and hesitate without good study method. If you feel depressed for your last failure, you should choose our NCP-DB-6.10 practice test materials. Most candidates choose our products and then clear exam one-shot. We are professional and authoritative exam dumps seller in this field. If you are looking for high-passing NCP-DB-6.10 Practice Test materials, we are the best option for you. One right choice will help you avoid much useless effort. Efficiency is life.

## **Latest NCP-DB-6.10 Exam Answers - The Best Nutanix Nutanix Certified Professional - Database Automation (NCP-DB) v6.10 - NCP-DB-6.10 Reliable Test Guide**

Itexamguide IT Certification has years of training experience. Itexamguide Nutanix NCP-DB-6.10 exam training materials is a reliable product. IT elite team continue to provide our candidates with the latest version of the NCP-DB-6.10 exam training materials. Our staff made great efforts to ensure that you always get good grades in examinations. To be sure, Itexamguide Nutanix NCP-DB-6.10 Exam Materials can provide you with the most practical IT certification material.

## **Nutanix Certified Professional - Database Automation (NCP-DB) v6.10 Sample Questions (Q236-Q241):**

### **NEW QUESTION # 236**

Which two encryption methods can be used when configuring an SMTP server? (Choose two.)

- A. IPsec
- B. S/MIME
- C. **TLS**
- D. **SSL**

**Answer: C,D**

#### Explanation:

NDB supports SMTP server configuration for sending email notifications and alerts. SMTP server configuration requires specifying the SMTP server address, port, username, password, and encryption method. The encryption method determines how the email messages are secured during transmission. NDB supports two encryption methods for SMTP server configuration: TLS and SSL. TLS (Transport Layer Security) is a protocol that encrypts and authenticates data between the email client and the SMTP server. TLS can operate in two modes: explicit and implicit. In explicit mode, the email client and the SMTP server negotiate the encryption method and parameters after establishing a plain text connection. This mode typically uses port 587. In implicit mode, the email client and the SMTP server assume that the connection is encrypted from the start, without any negotiation. This mode typically uses port 465.

SSL (Secure Sockets Layer) is a predecessor of TLS that also encrypts and authenticates data between the email client and the SMTP server. SSL operates in implicit mode only, and uses port

465 by default. SSL is less secure than TLS, but it is still widely used and supported by many email providers. S/MIME (Secure/Multipurpose Internet Mail Extensions) is a standard that encrypts and signs email messages at the application layer, rather than the transport layer.

S/MIME requires the use of digital certificates and public key cryptography to ensure the confidentiality and integrity of email messages. S/MIME is not a valid encryption method for SMTP server configuration, as it does not affect the connection between the email client and the SMTP server. IPsec (Internet Protocol Security) is a suite of protocols that secures IP packets at the network layer, rather than the application or transport layer. IPsec can encrypt and authenticate data between any two IP endpoints, such as routers, firewalls, or hosts. IPsec is not a valid encryption method for SMTP server configuration, as it does not apply to the specific protocol or port used by SMTP.

#### NEW QUESTION # 237

An administrator needs to restore a source database from a snapshot. The database shares the source volume with multiple other databases.

How does NDB handle this database restore operation?

- A. Replaces source volume with specific db disks
- B. Replaces the source volume with the snapshot volume
- C. Copies the specific database files to the source volume
- D. Copies all database files to the source volume

#### Answer: C

#### Explanation:

The correct answer is A because NDB handles the database restore operation by copying the specific database files from the snapshot volume to the source volume, without affecting the other databases that share the same source volume. NDB uses a copy-on-write mechanism to create snapshots and clones, which means that only the changes made to the database files are stored in the snapshot or clone volume, while the original files are kept in the source volume. Therefore, when restoring a source database from a snapshot, NDB only needs to copy the specific database files that have been modified since the snapshot was taken, and overwrite them on the source volume.

#### NEW QUESTION # 238

When an administrator no longer wants to use a software profile version, what happens when it is deprecated?

- A. It can no longer be used for provisioning.
- B. It can be used in provisioning.
- C. Any database server using that software profile can no longer be patched.
- D. Any database server using that profile will be updated to the latest software profile.

#### Answer: A

#### Explanation:

In Nutanix Database Service (NDB), when an administrator deprecates a software profile version, it is marked as obsolete and restricted from certain operations. Specifically, a deprecated software profile version can no longer be used for provisioning new database instances or VMs.

This ensures that only current, supported versions are utilized for new deployments, maintaining consistency and security. Existing database servers using the deprecated profile can continue to operate and may still be patched (if updates are compatible), but the profile itself is excluded from future provisioning tasks.

### NEW QUESTION # 239

An NDB administrator is looking to free up some space consumption in the container that NDB uses to manage a database landscape.

Where are two of the best locations within NDB that the administrator could view to see where the most storage is being consumed, in order to research for reclamation? (Choose two.)

- A. View the Clone Database table to determine the Size and Last Refresh of clone databases.
- B. View the Snapshot table in Time Machine to determine Reclaimable Space and Age of snapshots that have been taken.
- C. NDB Dashboard and view the Clone Data Age in days.
- D. View the Source Database grid to determine the size and status of registered databases.

**Answer: A,B**

Explanation:

To free up space in the NDB-managed container, the administrator needs to identify storage consumption sources. Two key locations in NDB provide actionable insights:

Clone Database table: This displays all clone databases, including their Size (current storage usage) and Last Refresh (indicating age or staleness). Clones often consume significant space, and older or unused ones can be deleted to reclaim storage.

Snapshot table in Time Machine: This shows snapshots with details like Reclaimable Space (space recoverable by deletion) and Age (how long snapshots have existed). Old or unnecessary snapshots are prime candidates for reclamation.

### NEW QUESTION # 240

An administrator needs to increase storage for a MongoDB database provisioned using NDB.

After launching the NDB CLI, the administrator begins with creating the input file for this operation. Which parameter should the administrator include within the input file?

- A. extend\_storage
- B. update
- C. data\_percent
- D. database

**Answer: A**

Explanation:

To increase storage for a MongoDB database provisioned using NDB, the administrator needs to use the extend\_storage parameter in the input file for the NDB CLI. This parameter specifies the amount of additional storage to be added to the database server VM in GB. For example, if the current storage size is 100 GB and the administrator wants to increase it to 150 GB, the input file should contain the following line: extend\_storage: 50

### NEW QUESTION # 241

.....

Now, the test syllabus of the NCP-DB-6.10 exam is changing every year. More and more people choose to prepare the exam to improve their ability. So the NCP-DB-6.10 exam becomes more difficult than before. For our experts, they are capable of seizing the tendency of the real exam. The questions and answers of our NCP-DB-6.10 Guide materials will change every year according to the examination outlines. And we always keep them to be the latest and accurate.
