CompTIA DataSys+ Certification Exam Sample Questions (Q19-Q24):

NEW QUESTION # 19

A company needs information about the performance of users in the sales department. Which of the following commands should a database administrator use for this task?

- A. UPDATE
- **B. SELECT**
- C. DROP
- D. DELETE

Answer: B

Explanation:

The command that the database administrator should use for this task is SELECT. The SELECT command is a SQL statement that retrieves data from one or more tables or views in a database.

The SELECT command can also use various clauses or options to filter, group, sort, or aggregate data according to specific criteria or conditions. By using the SELECT command, the database administrator can obtain information about the performance of users in the sales department, such as their sales volume, revenue, commission, etc. The other options are either not related or not suitable for this task. For example, DROP is a SQL command that deletes an existing table or object from a database; UPDATE is a SQL command that modifies existing data in one or more rows of a table; DELETE is a SQL command that removes existing data from one or more rows of a table.

NEW QUESTION # 20

Which of the following is most likely to prevent tampering with server hardware that houses data?

- A. Network firewall
- B. Strong password policy
- C. Surveillance cameras
- **D. Biometric locks**

Answer: D

Explanation:

The option that is most likely to prevent tampering with server hardware that houses data is biometric locks.

Biometric locks are devices that use biological characteristics, such as fingerprints, facial recognition, iris scan, etc., to control access to a physical location or resource. Biometric locks help prevent tampering with server hardware that houses data by restricting unauthorized entry or theft of the hardware by intruders or attackers. Biometric locks also provide higher security and convenience than other types of locks, such as keys or passwords, which can be lost, stolen, or forgotten. The other options are either not related or not effective for this purpose. For example, a strong password policy is a set of rules or standards for creating and managing passwords for user accounts or systems; a network firewall is a device or software that controls the incoming and outgoing traffic on a network based on a set of rules or policies; surveillance cameras are devices that capture and record video footage of a physical location or resource. NEW QUESTION # 21

A database administrator is new to a company and wants to create a document that illustrates the interaction between tables. Which of the following should the administrator create?

- A. Data dictionary
- B. Troubleshooting guide
- **C. Entity relationship diagram**

- D. Database reference manual

Answer: C

Explanation:

The document that the administrator should create to illustrate the interaction between tables is an entity relationship diagram. An entity relationship diagram (ERD) is a graphical representation of the entities (tables), attributes (columns), and relationships (constraints) in a database. An ERD helps the administrator to visualize the structure and design of the database, as well as the dependencies and associations among the tables. The other options are either different types of documents or not related to the interaction between tables. For example, a troubleshooting guide is a document that provides instructions on how to solve common problems or errors in a database; a data dictionary is a document that describes the metadata (information about data) of a database; a database reference manual is a document that provides information on how to use or operate a database.

NEW QUESTION # 22

As part of an integrity check, a database administrator is creating both the primary and secondary snapshots. The database administrator notices the primary replica is failing over to the secondary replica. Which of the following describes how this will affect the database?

- A. All the information in the database will be lost.
- **B. The database will not be impacted.**
- C. The database will shut down unexpectedly.
- D. All the data will have to be copied to a new primary snapshot.

Answer: B

Explanation:

Failover from a primary to a secondary replica in a properly configured environment is designed to be seamless, maintaining database availability and integrity without impacting operations.

NEW QUESTION # 23

Which of the following cloud delivery models is typically used in environments where organizations delegate control of runtimes, middleware, and compute resources that focus mostly on applications?

- **A. PaaS**
- B. DBaaS
- C. SaaS
- D. IaaS

Answer: A

Explanation:

Platform as a Service (PaaS) provides environments where organizations manage applications while the provider controls runtimes, middleware, and compute resources.
