**Answer: C**

Explanation:

Points to remember:

\* XML must have a root element.

\* XML only allows one root element

\* To avoid multiple root issues, you must create a root element for the XML output, whenever we transform output

\* When mapping array elements (JSON or JAVA) to XML, wrap the map operations in {(..)}

- { } are defining the object

( ) are transforming each element in the array as a key/value pair

\* The transformation to XML would fail if the above mentioned considerations were not taken into account.

\* Thus the transformation script declares a root element as trains and wraps the data in "{( )}".

Whenever you see such type of question, always look out for root element followed by {( ) } wrapping map.

I call this a "Wrap The Map" scenario. Hope it would help you remember !
