질문 # 89

A host has LUNs assigned through a Masking View containing one regular Storage Group. The Storage Group has the gold service level assigned. One LUN requires a higher service level. What is the correct sequence of steps required to assign the platinum service level to that LUN?

정답:

질문 # 90

What function does the storsrvd daemon support?

- A. Listens for SYMCLI sessions and management requests
- B. Provides centralized gatekeeper device management
- C. Manages Composite Groups and Device Groups
- D. Provides replication consistency protection

정답: A

설명:

The storsrvd daemon is a critical component of the Solutions Enabler (SYMCLI) software suite used to manage Dell PowerMax

and VMAX storage arrays. Its primary function is to:

* Listen for SYMAPI Sessions: It acts as a communication endpoint, listening for incoming SYMAPI sessions from clients or management tools like Unisphere.

* Handle Management Requests: When a client connects, storsrvd receives and processes SYMAPI commands and requests, forwarding them to the appropriate components within Solutions Enabler for execution.

Essentially, storsrvd acts as an intermediary between SYMCLI clients and the storage array, facilitating communication and management operations.

Why other options are incorrect:

* A. Manages Composite Groups and Device Groups: This is handled by other components within Solutions Enabler.

* B. Provides centralized gatekeeper device management: While storsrvd plays a role in device management, it's not the sole component responsible for it.

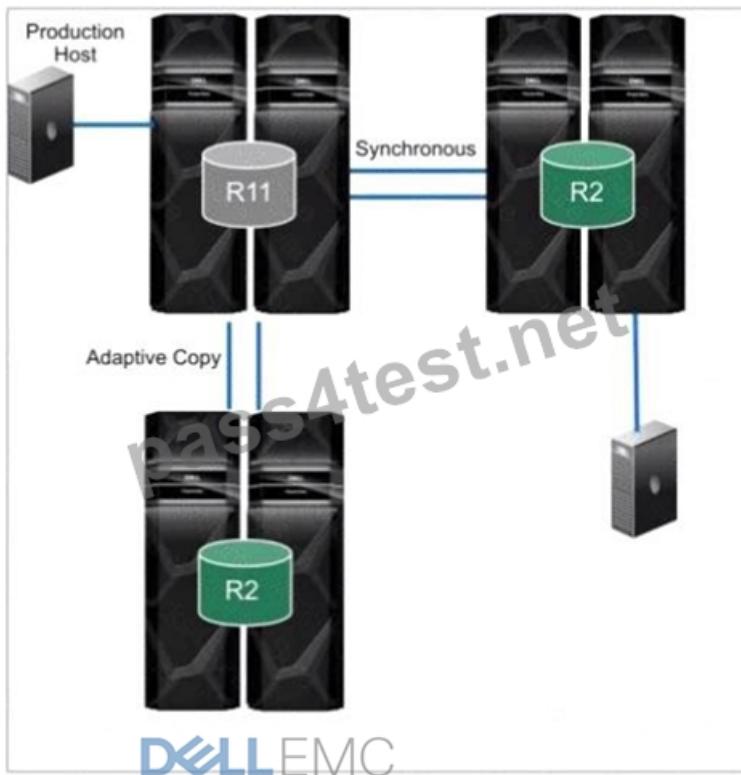

* C. Provides replication consistency protection: This is a function of SRDF (Symmetrix Remote Data Facility) and related components.

질문 # 91

Refer to the exhibit.

What is the topology shown?

- A. Concurrent SRDF
- B. Cascaded SRDF
- C. SRDF/Metro
- D. SRDF/Star

정답: B

설명:

Step by Step Comprehensive Detailed Explanation:

The topology shown in the exhibit depicts Cascaded SRDF. This SRDF configuration involves three storage arrays (or sites) connected in a chained or cascaded manner.

Here's how it works:

* Primary Site (R1): The production host is connected to the primary storage array (R1).

- * Intermediate Site (R2): The primary array (R1) synchronously replicates data to an intermediate array (R2).
- * Remote Site (R2): The intermediate array (R2) then asynchronously replicates data to a remote array (also labeled R2 in the diagram).

This cascading setup provides a multi-hop disaster recovery solution, where data is first replicated synchronously to a nearby site for high availability and then asynchronously replicated to a further remote site for disaster recovery.

Why other options are incorrect:

- * B. SRDF/Star: SRDF/Star involves a central array replicating to multiple remote arrays in a star-like pattern.
- * C. SRDF/Metro: SRDF/Metro is designed for synchronous replication over short distances, typically within a metropolitan area.
- * D. Concurrent SRDF: Concurrent SRDF allows multiple SRDF relationships to exist simultaneously for the same device.

질문 # 92

Which tasks can a storage administrator manage from the Data Protection menu in the Unisphere for PowerMax?

- A. Configure Data Protection for z systems
- **B. Configure and manage SRDF groups**
- C. Review the audit log for unwanted logins
- D. Convert front-end ports to SRDF ports

정답: **B**

설명:

Step by Step Comprehensive Detailed Explanation:

The "Data Protection" menu in Unisphere for PowerMax provides a centralized location for managing various data protection features and functionalities. Specifically, it allows storage administrators to:

* Configure and manage SRDF groups: SRDF (Symmetrix Remote Data Facility) is a key technology for disaster recovery and data replication in PowerMax. The Data Protection menu enables administrators to create, modify, and monitor SRDF groups, establish replication relationships between devices, and control replication settings.

Why other options are incorrect:

- * A. Convert front-end ports to SRDF ports: This is typically done through the "System > Hardware" or "Connectivity" sections of Unisphere, where port configurations are managed.
- * C. Configure Data Protection for z Systems: While PowerMax supports mainframe environments, the specific configuration for z Systems might involve specialized tools or interfaces.
- * D. Review the audit log for unwanted logins: Audit logs and security-related events are usually found in the "Monitoring" or "Security" sections of Unisphere.
