## WGU Managing Cloud Security (JY02) Sample Questions (Q122-Q127):

### NEW QUESTION # 122

Which jurisdictional data protection was enacted in the United States to avoid forced disclosure from ISPs?

- A. APP8
- B. General Data Protection Regulation (GDPR)
- C. APP11.1
- **D. Stored Communications Act (SCA)**

**Answer: D**

Explanation:

The Stored Communications Act (SCA) is a United States jurisdictional data protection law enacted to limit and regulate forced disclosure of electronic communications by internet service providers. Managing Cloud principles describe the SCA as a legal framework that governs how stored electronic communications and customer data may be accessed by government entities.

The act establishes requirements for warrants, subpoenas, and court orders before service providers can disclose stored data. This protection is particularly relevant in cloud environments, where service providers store large volumes of customer data on behalf of organizations.

The other options are incorrect. APP8 and APP11.1 are Australian Privacy Principles, and GDPR applies to the European Union. Therefore, the Stored Communications Act is the correct U.S. jurisdictional protection.

### NEW QUESTION # 123

A security analyst is tasked with compiling a report of all people who used a system between two dates. The thorough report must include information about how long and how often the system was used. Which information should the analyst ensure is in the report?

- A. Informational logs and message of the day
- B. User commands and error timestamps
- **C. User identifications and access timestamps**
- D. Environmental errors and 802.1x logs

**Answer: C**

Explanation:

To provide a comprehensive report of system usage, the most important elements are user identifications (IDs) and access timestamps. These data points record who accessed the system, at what time, and for how long. Together, they allow the analyst to determine frequency and duration of use, which is essential for both operational auditing and security oversight.

Other options, such as informational logs or error logs, may provide context but do not directly answer the requirement of identifying users and usage patterns. For instance, 802.1x logs are related to network authentication, while commands or error timestamps reveal activity details but not the overall access history.

Collecting and analyzing IDs and timestamps supports compliance with regulatory frameworks like ISO 27001 and SOC 2, which require clear audit trails. It also provides accountability and supports investigations in case of unauthorized access or misuse. By including these elements, the analyst ensures the report meets internal and external requirements for system monitoring.

### NEW QUESTION # 124

Which cloud architecture model provides application development services?

- A. Software as a Service (SaaS)
- B. Security as a Service (SECaaS)
- **C. Platform as a Service (PaaS)**
- D. Infrastructure as a Service (IaaS)

**Answer: C**

Explanation:

Platform as a Service (PaaS) provides application development services in cloud environments. Managing Cloud documentation explains that PaaS delivers development frameworks, programming languages, libraries, databases, and testing tools required to build and deploy applications.

This model eliminates the need to manage infrastructure and operating systems, allowing developers to rapidly create, test, and deploy applications. PaaS also supports scalability and integration with other cloud services.

SaaS delivers completed applications, IaaS provides raw infrastructure, and SECaaS focuses on security services. Therefore, PaaS is the correct model for application development services.

### NEW QUESTION # 125

Which aspect of strong authentication is part of enterprise risk management?

- A. Entitlement consideration
- **B. Privileged user management**
- C. Distributed organizations
- D. Federated identities

**Answer: B**

Explanation:

Privileged user management is a critical aspect of strong authentication within enterprise risk management.

Managing Cloud guidance explains that privileged accounts have elevated access to systems, data, and configurations, making them high-value targets for attackers.

Enterprise risk management requires identifying, protecting, and monitoring these accounts through strong authentication mechanisms such as multi-factor authentication, session monitoring, and just-in-time access.

Controlling privileged access reduces the risk of insider threats, credential compromise, and unauthorized system changes.

Federated identities support access integration, entitlement consideration relates to authorization, and distributed organizations describe structure rather than authentication strength. Therefore, privileged user management is the correct answer.

### NEW QUESTION # 126

Which phase in secure application design and development includes threat modeling?

- A. Training
- B. Define
- C. Develop
- **D. Design**

**Answer: D**

Explanation:

Threat modeling is performed during the Design phase of secure application development. Managing Cloud guidance explains that threat modeling evaluates application architecture, data flows, trust boundaries, and attack surfaces before development begins.

By identifying threats early, security controls can be built directly into the application design rather than added later. This reduces vulnerabilities and lowers remediation costs.

The define phase establishes requirements, training builds skills, and development focuses on coding.

Therefore, the design phase is the correct answer.
