Practical Salesforce Identity-and-Access-Management-Architect Information | Identity-and-Access-Management-Architect New Dumps

Life is beset with all different obstacles that are not easily overcome. For instance, Identity-and-Access-Management-Architect exams may be insurmountable barriers for the majority of population. However, with the help of our Identity-and-Access-Management-Architect exam questions, exams are no longer problems for you. The reason why our Identity-and-Access-Management-Architect Training Materials outweigh other Identity-and-Access-Management-Architect study prep can be attributed to three aspects, namely free renewal in one year, immediate download after payment and simulation for the software version.

Salesforce Certified Identity and Access Management Architect (IAM) Exam is a certification program designed for professionals

who specialize in identity and access management solutions. Identity-and-Access-Management-Architect Exam is an advanced-level certification that validates an individual's expertise in designing and implementing security solutions using Salesforce's Identity and Access Management platform. Salesforce Certified Identity and Access Management Architect certification is ideal for professionals who have extensive experience in security architecture, identity management, and access control.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q51-Q56):

NEW QUESTION # 51

Universal Containers wants to set up SSO for a selected group of users to access external applications from Salesforce through App Launcher. Which three steps must be completed in Salesforce to accomplish the goal?

- A. Complete my domain and Identity provider setup.
- B. Create named credentials for each external system.
- C. Associate user profiles with the connected Apps.
- D. Create connected apps for the external applications.
- E. Complete single Sign-on settings in security controls.

Answer: A,C,D

NEW QUESTION # 52

Containers (UC) has decided to implement a federated single Sign-on solution using a third-party IdP. In reviewing the third-party products, they would like to ensure the product supports the automated provisioning and deprovisioning of users. What are the underlining mechanisms that the UC Architect must ensure are part of the product?

- A. Provisioning API for both Provisioning and Deprovisioning.
- B. SOAP API for provisioning; Just-in-Time (JIT) for Deprovisioning.
- C. Just-In-time (JIT) for Provisioning; SOAP API for Deprovisioning.
- D. Just-in-Time (JIT) for both Provisioning and Deprovisioning.

Answer: D

NEW QUESTION # 53

Universal Containers (UC) has a classified information system that its call centre team uses only when they are working on a case with a record type of "classified". They are only allowed to access the system when they own an open "classified" case, and their access to the system is removed at all other times. They would like to implement SAML SSO with Salesforce as the IDP, and automatically allow or deny the staff's access to the classified information system based on whether they currently own an open "classified" case record when they try to access the system using SSO. What is the recommended solution for automatically allowing or denying access to the classified information system based on the open "classified" case record criteria?

- A. Use Apex trigger on case to dynamically assign permission sets that grant access when a user is assigned with an open "classified" case, and remove it when the case is closed.
- B. Use Salesforce reports to identify users that currently own open "classified" cases and should be granted access to the classified information system.
- C. Use a custom connected App handler using Apex to dynamically allow access to the system based on whether the staff owns any open "classified" cases.
- D. Use custom SAML JIT provisioning to dynamically query the user's open "classified" cases when attempting to access the classified information system.

Answer: C

Explanation:

Use a custom connected app handler using Apex to dynamically allow access to the system based on whether the staff owns any open "classified" cases is the recommended solution for this scenario. A custom connected app handler is an Apex class that implements the ConnectedAppPlugin interface and can customize the behavior of a connected app. The custom handler can support new protocols or respond to user attributes in a way that benefits a business process. In this case, the custom handler can query the user's open "classified" cases and grant or deny access to the classified information system accordingly. Use Apex trigger on case to dynamically assign permission sets that grant access when a user is assigned with an open "classified" case, and remove it when the

case is closed is not a good solution, as permission sets are not related to SSO and cannot control access to external systems. Use custom SAML JIT provisioning to dynamically query the user's open "classified" cases when attempting to access the classified information system is not feasible, as JIT provisioning is used to create or update user records in Salesforce, not in external systems. Use Salesforce reports to identify users that currently own open "classified" cases and should be granted access to the classified information system is not an automated solution, as it requires manual intervention and does not leverage SSO. NEW QUESTION # 54

Universal Containers (UC) is setting up their customer Community self-registration process. They are uncomfortable with the idea of assigning new users to a default account record. What will happen when customers self-register in the community?

- A. The self-registration page will create a new account record.
- B. The self-registration page will ask user to select an account.
- C. The self-registration process will produce an error to the user.
- **D. The self-registration process will create a person Account record.**

Answer: D

Explanation:

When customers self-register in the community, the self-registration process will create a person account record. A person account is a special type of account that combines both account and contact information in one record. This allows customers to have their own individual accounts without being associated with a default account. Option A is not a good choice because the self-registration process will not produce an error to the user, unless there is some configuration or validation issue. Option B is not a good choice because the self-registration page will not ask user to select an account, unless it is customized to do so. Option D is not a good choice because the self-registration page will not create a new account record, unless it is customized to do so.

NEW QUESTION # 55

Northern Trail Outfitters (NTO) is planning to implement a community for its customers using Salesforce Experience Cloud. Customers are not able to self-register. NTO would like to have customers set their own passwords when provided access to the community.

Which two recommendations should an identity architect make to fulfill this requirement?

Choose 2 answers

- A. Enable Welcome emails while configuring the Experience Cloud site.
- B. Add customers as contacts and add them to Experience Cloud site.
- **C. Allow Password reset using the API to update Experience Cloud site membership.**
- **D. Use Login Flows to allow users to reset password in Experience Cloud site.**

Answer: C,D

Explanation:

Explanation

Allowing password reset using the API and using login flows are two possible ways to enable customers to set their own passwords in Experience Cloud. The other options are not relevant for this requirement, as they do not address the password issue. References: Allow Password Reset Using the API, Use Login Flows to Allow Users to Reset Passwords in Experience Cloud Sites
