### Salesforce Certified Slack Developer Sample Questions (Q191-Q196):

#### NEW QUESTION # 191

When is it most appropriate to use the SCIM API in a Slack workspace?

- A. For developing a Slack app feature that tracks user engagement and message analytics within the workspace
- B. To customize the visual themes and layout of Slack channels for individual users

- C. When integrating Slack with an external identity management system for streamlined user provisioning and group management
- D. For creating a custom Slack bot that facilitates interactive polls and quizzes in channels

**Answer: C**

Explanation:

When integrating Slack with an external identity management system for streamlined user provisioning and group management The SCIM API is most appropriately used when integrating Slack with an external identity management system. This allows for streamlined user provisioning, deprovisioning, and group management, automating the process of syncing user and group data between Slack and the identity management system.

Why not the other options:

- \*The SCIM API is not intended for creating interactive elements like bots.
- \*The SCIM API does not deal with customizing visual themes or layouts.
- \*The SCIM API is not designed for tracking user engagement or message analytics.

### NEW QUESTION # 192

What is an important expectation to meet when submitting an app to the Slack Directory?

- A. Providing a subscription-based monetization model within the app to ensure ongoing financial viability
- B. Ensuring that the app adheres to Slack's security standards and has passed a thorough security review process
- C. The app should be capable of functioning independently without any integration with Slack's APIs
- D. The app must offer unique functionalities not found in any existing apps in the Slack Directory

**Answer: B**

Explanation:

Ensuring that the app adheres to Slack's security standards and has passed a thorough security review process An important expectation for apps submitted to the Slack Directory is adherence to Slack's security standards, including passing a thorough security review process. This ensures that the app is safe for users and maintains the integrity and security of Slack workspaces where the app will be installed.

Why not the other options:

- \*While uniqueness is valued, it is not a strict requirement for submission to the Slack Directory.
- \*The app must integrate with Slack's APIs to provide functionalities within Slack.
- \*Having a subscription-based monetization model is not a prerequisite for app submission to the Slack Directory.

### NEW QUESTION # 193

Your Slack app requires the storage of OAuth tokens after user authorization.

What is the most secure way to store these tokens?

- A. Keep the tokens in client-side storage, like local storage or cookies, for quick retrieval
- B. Embed the tokens directly within the app's source code for streamlined access
- C. Encrypt the tokens and store them in a secure database with access controls
- D. Store the tokens in a publicly accessible configuration file for ease of access by the app

**Answer: C**

Explanation:

Encrypt the tokens and store them in a secure database with access controls Encrypting OAuth tokens and storing them in a secure database with access controls is the best practice for security. This method ensures that the tokens are protected from unauthorized access and reduces the risk of token leakage or theft.

Why not the other options:

- \*Storing tokens in a publicly accessible file poses a significant security risk.
- \*Storing sensitive tokens in client-side storage can expose them to various security vulnerabilities, such as XSS attacks.
- \*Embedding tokens in the app's source code is highly insecure, especially if the codebase is accessible or shared.

### NEW QUESTION # 194

Your team is developing a Slack app that requires fetching detailed user information, including custom fields, for a report.

Which Slack API is best suited for this task?

- **A. Web API using the users.list method**
- B. Events API
- C. Slash Commands
- D. RTM (Real-Time Messaging) API

**Answer: A**

Explanation:

Web API using the users.list method The Web API with the users.list method is the most suitable for fetching detailed user information, including custom fields. This method provides comprehensive data about users in the Slack workspace.

Why not the other options:

\*The RTM API is designed for real-time messaging, not for fetching detailed user information.

\*The Events API is used to respond to specific events within Slack, not for extracting user data.

\*Slash Commands are for executing commands within Slack and do not provide user information or reports.

### NEW QUESTION # 195

A company is planning to develop a Slack app that integrates with their external project management system. This app needs to synchronize project updates and allow task assignments within Slack. When should a collaborative team be set up for this development?

- A. Only during the coding phase of the app
- B. After the first version of the app is completed
- **C. As soon as the project is approved**
- D. Once user feedback is received post-deployment

**Answer: C**

Explanation:

As soon as the project is approved Setting up a collaborative team right from the project's approval ensures that all aspects of the app, from understanding the integration requirements to designing the user interface, are considered and addressed effectively. Early collaboration helps in aligning the app development with the business needs and technical constraints.

Why not the other options:

\*Waiting until the coding phase may lead to overlooking design and integration considerations.

\*Completing the first version without collaboration could result in missing critical functionality and integration needs.

\*Waiting for user feedback post-deployment misses out on the essential collaborative input during development phases.
