2026 Latest Pass4guide 350-701 PDF Dumps and 350-701 Exam Engine Free Share: <https://drive.google.com/open?id=12REllzpfK8hfg6oDQgS6-aWytZ5vOFR->

In order to provide the most effective 350-701 exam materials which cover all of the current events for our customers, a group of experts in our company always keep an close eye on the changes of the 350-701 exam even the smallest one, and then will compile all of the new key points as well as the latest types of exam questions into the new version of our 350-701 Practice Test, and you can get the latest version of our study materials for free during the whole year. Do not lose the wonderful chance to advance with times.

Cisco 350-701 certification exam is designed for security professionals who wish to validate their knowledge and expertise in implementing and operating Cisco security core technologies. 350-701 Exam Tests an individual's ability to implement and manage security solutions effectively, detect and mitigate security threats, and secure networks and devices.

Online 350-701 Training Materials & New 350-701 Test Format

If you are ambitious and diligent, our 350-701 study materials will lead you to the correct road. Thousands of people have regain hopes for their life after accepting the guidance of our 350-701 exam simulating. You should never regret for the past. Future will be full of good luck if you choose our 350-701 Guide materials. We will be responsible for you. And we will be always on you side from the day to buy our 350-701 practice engine until you finally pass the exam and get the certification.

Cisco Implementing and Operating Cisco Security Core Technologies Sample Questions (Q713-Q718):

NEW QUESTION # 713

Which statement about IOS zone-based firewalls is true?

- A. Only one interface can be assigned to a zone.

- B. An unassigned interface can communicate with assigned interfaces
- **C. An interface can be assigned only to one zone.**
- D. An interface can be assigned to multiple zones.

Answer: C

Explanation:

IOS zone-based firewalls (ZBFW) are a feature that provides stateful firewall policies between groups of interfaces known as zones. A zone is a logical grouping of one or more interfaces that have similar security requirements. A zone can be applied to physical interfaces, subinterfaces, port channels, VLAN interfaces, or tunnel interfaces. However, an interface can be assigned only to one zone, and it cannot be shared between zones. This is because the ZBFW policy is applied between zones, not interfaces, and it controls the bidirectional traffic flow between them. Therefore, an interface can belong to only one zone at a time, and it must be removed from one zone before it can be added to another zone. This ensures that the firewall policy is consistent and unambiguous for each interface.

NEW QUESTION # 714

Which direction do attackers encode data in DNS requests during exfiltration using DNS tunneling?

- A. inbound
- B. east-west
- C. north-south
- **D. outbound**

Answer: D

Explanation:

DNS tunneling is a technique that encodes data of other programs and protocols in DNS queries, including data payloads that can be used to control a remote server and applications¹. DNS exfiltration is a form of DNS tunneling that allows attackers to extract data from a compromised system by sending encoded DNS requests to a domain under their control². The direction of the data transfer in DNS exfiltration is outbound, meaning from the victim's network to the attacker's network. This is different from inbound, which means from the attacker's network to the victim's network, or north-south and east-west, which are terms used to describe the traffic flow between different network segments or zones³. Outbound DNS requests are often allowed by default in many firewalls and network devices, making them an attractive channel for data exfiltration⁴. However, DNS exfiltration can be detected and prevented by using security solutions that monitor and analyze DNS traffic for anomalies and malicious patterns⁵.

NEW QUESTION # 715

Which network monitoring solution uses streams and pushes operational data to provide a near real-time view of activity?

- A. SMTP
- **B. model-driven telemetry**
- C. syslog
- D. SNMP

Answer: B

Explanation:

The traditional use of the pull model, where the client requests data from the network does not scale when what you want is near real-time data. Moreover, in some use cases, there is the need to be notified only when some data changes, like interfaces status, protocol neighbors change etc.

Model-Driven Telemetry is a new approach for network monitoring in which data is streamed from network devices continuously using a push model and provides near real-time access to operational statistics.

Applications can subscribe to specific data items they need, by using standard-based YANG data models over NETCONF-YANG. Cisco IOS XE streaming telemetry allows to push data off of the device to an external collector at a much higher frequency, more efficiently, as well as data on-change streaming.

NEW QUESTION # 716

An organization wants to secure data in a cloud environment. Its security model requires that all users be authenticated and authorized. Security configuration and posture must be continuously validated before access is granted or maintained to applications and data. There is also a need to allow certain application traffic and deny all other traffic by default. Which technology must be used to implement these requirements?

- A. Virtual LAN
- B. Virtual routing and forwarding
- C. Access control policy
- D. Microsegmentation

Answer: D

Explanation:

Explanation

Zero Trust is a security framework requiring all users, whether in or outside the organization's network, to be authenticated, authorized, and continuously validated for security configuration and posture before being granted or keeping access to applications and data. Zero Trust assumes that there is no traditional network edge; networks can be local, in the cloud, or a combination or hybrid with resources anywhere as well as workers in any location.

The Zero Trust model uses microsegmentation - a security technique that involves dividing perimeters into small zones to maintain separate access to every part of the network - to contain attacks.

NEW QUESTION # 717

An engineer needs a cloud solution that will monitor traffic, create incidents based on events, and integrate with other cloud solutions via an API. Which solution should be used to accomplish this goal?

- A. Cisco Cloudlock
- B. CASB
- C. Adaptive MFA
- D. SIEM

Answer: A

Explanation:

Explanation:

+ Cisco Cloudlock continuously monitors cloud environments with a cloud Data Loss Prevention (DLP) engine to identify sensitive information stored in cloud environments in violation of policy.

+ Cloudlock is API-based.

+ Incidents are a key resource in the Cisco Cloudlock application. They are triggered by the Cloudlock policy engine when a policy detection criteria result in a match in an object (document, field, folder, post, or file).

Reference: <https://docs.umbrella.com/cloudlock-documentation/docs/endpoints>Note:+ Security information and event management (SIEM) platforms collect log and event data from security systems, networks and computers, and turn it into actionable security insights.+ An incident is a record of the triggering of an alerting policy. Cloud Monitoring opens an incident when a condition of an alerting policy has been met.

NEW QUESTION # 718

.....

We abandon all obsolete questions in this latest 350-701 exam torrent and compile only what matters toward actual real exam. The downloading process is operational. It means you can obtain 350-701 quiz torrent within 10 minutes if you make up your mind. Do not be edgy about the exam anymore, because those are latest 350-701 Exam Torrent with efficiency and accuracy. You will not need to struggle with the exam. Besides, there is no difficult sophistication about the procedures, our latest 350-701 exam torrent materials have been in preference to other practice materials and can be obtained immediately.
