

# 112-57 Exam Registration & 112-57 Test Book

Many of the candidates like the Soft version of our 112-57 exam questions. The software of 112-57 guide torrent boosts varied self-learning and self-assessment functions to check the results of the learning. The software can help the learners find the weak links and deal with them. Our 112-57 Exam Questions boost timing function and the function to stimulate the exam. Our product sets the timer to stimulate the exam to adjust the speed and keep alert. So it is worthy for you to buy our 112-57 exam questions.

By focusing on how to help you more effectively, we encourage exam candidates to buy our 112-57 study braindumps with high passing rate up to 98 to 100 percent all these years. Our experts designed three versions for you rather than simply congregate points of questions into 112-57 real questions. Efforts conducted in an effort to relieve you of any losses or stress. So our activities are not just about profitable transactions to occur but enable exam candidates win this exam with the least time and get the most useful contents. We develop many reliable customers with our high quality 112-57 Prep Guide. When they need the similar exam materials and they place the second even the third order because they are inclining to our 112-57 study braindumps in preference to almost any other.

## 112-57 Test Book, Exam 112-57 Quick Prep

Most of the candidates remain confused about the format of the actual 112-57 exam and the nature of questions therein. So our 112-57 exam questions can perfectly provide them with the newest information about the exam not only on the content but also on the format. And to help them adjust to the real exam, we also developed the Software version of the 112-57 learning prep which can simulate the real exam.

## EC-COUNCIL EC-Council Digital Forensics Essentials (DFE) Sample Questions (Q14-Q19):

### NEW QUESTION # 14

Which of the following layers of the TCP/IP model serves as the backbone for data flow between two devices in a network and enables peer entities on the source and destination devices to communicate with each other?

- A. Internet layer
- B. Application layer

- C. Network access layer
- **D. Transport layer**

**Answer: D**

Explanation:

In the TCP/IP model, the Transport layer is responsible for end-to-end communication between peer entities on the source and destination systems. "Peer entities" here refers to the corresponding transport components (and the applications that use them) on two different hosts communicating across a network. This layer forms the practical "backbone" of host-to-host data flow because it provides the mechanisms that allow data to be delivered from one endpoint process to another endpoint process reliably or efficiently, depending on the protocol used.

The Transport layer includes protocols such as TCP and UDP. TCP supports connection-oriented communication with sequencing, acknowledgments, retransmissions, and flow control—features that are fundamental when reconstructing sessions during network forensic investigations (e.g., rebuilding a file transfer or a web session). UDP provides connectionless delivery used by many services where speed is preferred over guaranteed delivery, which is also significant in investigations of DNS, streaming, or certain malware communications.

By contrast, the Internet layer focuses on logical addressing and routing (IP), the Network access layer handles local delivery on the physical/link network, and the Application layer provides user-facing protocols.

Therefore, the layer enabling peer communication between endpoints is the Transport layer (C).

### NEW QUESTION # 15

Alice and John are close college friends. Alice frequently sends emails to John attaching her pics with friends.

One day, Alice sent an email to John describing all the details related to the final year project without specifying the actual purpose.

John missed the message as he frequently receives emails from her and did not arrive for a project seminar.

Which of the following email fields could Alice have used in the above scenario to highlight the importance of the email?

- A. Cc
- **B. Subject**
- C. Bcc
- D. Date

**Answer: B**

Explanation:

The Subject field is the primary email header element used to communicate the purpose and urgency of a message at a glance. Digital forensics training emphasizes that email messages consist of headers (routing and descriptive metadata) and a body (content). Among user-visible header fields, the Subject line is specifically intended to summarize what the email is about, helping recipients prioritize and correctly interpret the message without opening it. In the scenario, John routinely receives casual emails from Alice (often with pictures). When Alice sent a project-related email "without specifying the actual purpose," John treated it like routine mail and overlooked its significance. A clear, descriptive subject such as "Final Year Project Seminar - Attendance Required" would have flagged the message as time-sensitive and different from her usual emails, reducing the chance it would be missed.

The other options do not serve this purpose. Date is automatically assigned and mainly supports ordering and timeline reconstruction rather than highlighting importance. Cc and Bcc control who receives copies and can affect visibility or secrecy, but they do not summarize intent for the recipient. Therefore, the field best suited to highlight importance is Subject (A).

### NEW QUESTION # 16

Which of the following network protocols creates secure tunneling through which content obfuscation can be achieved?

- A. UDP
- B. ARP
- **C. SSH**
- D. SNMP

**Answer: C**

Explanation:

SSH (Secure Shell) is specifically designed to provide an encrypted channel over an untrusted network. In digital forensics and incident response, SSH is well known for supporting tunneling/port forwarding, where traffic for another protocol (for example,

HTTP, database connections, or remote desktop) is encapsulated inside an SSH session. Because the SSH session encrypts payload data (and can also protect authentication and command content), the tunneled traffic becomes obfuscated to network monitoring tools that can only see metadata such as source/destination IPs, port numbers (often TCP/22), timing, and byte counts. This capability is frequently discussed in forensic references as a mechanism that can hinder content inspection and complicate attribution of user actions purely from packet payload analysis.

By contrast, SNMP is primarily for network management and monitoring, not secure tunneling. ARP resolves IP- to-MAC addresses on local networks and does not provide encryption or tunneling. UDP is a transport protocol that can carry data for many applications but provides no built-in security or tunneling features by itself.

Therefore, the protocol that creates secure tunneling enabling content obfuscation is SSH (C).

event logs) to establish user intent and sequence of actions. Therefore, the correct option is BrowsingHistoryView (B).

### NEW QUESTION # 17

Which of the following folders of macOS stores all the files, documents, applications, library folders, etc. pertaining to a particular user?

- A. Home Directory
- B. Spotlight
- C. Finder
- D. Time Machine

**Answer: A**

Explanation:

In macOS, each user account is assigned a Home Directory that serves as the primary container for that user's data and profile-specific configuration. This directory typically resides under /Users/<username>/ and includes standard subfolders such as Desktop, Documents, Downloads, Pictures, Movies, Music, and crucially the user's Library folder (~/.Library). From a digital forensics standpoint, the Home Directory is one of the most important evidence locations because it holds user-generated content and a large volume of user activity artifacts: application preferences and settings (plist files), browser data, caches, saved state, key application databases, recent items, and other per-user traces. Although some applications are installed system-wide under /Applications, macOS also supports per-user application storage and extensive per-user data under the Home Directory's Library structure.

The other options are not user-data containers. Spotlight is a search/indexing service (it creates indexes, not a user's complete data store). Time Machine is a backup mechanism that stores versioned backups rather than the live per-user working directory. Finder is the graphical file manager, not a storage folder. Therefore, the folder that stores files and user-specific libraries for a particular user is the Home Directory (D).

### NEW QUESTION # 18

Steve, a professional hacker, attempted to hack Alice's banking account. To accomplish his goal, Steve used an automated tool to guess Alice's login credentials. The tool uses a trial-and-error method by attempting all possible combinations of usernames and passwords to determine the valid credentials.

Identify the type of attack initiated by Steve in the above scenario.

- A. Trojan horse attack
- B. Data manipulation attack
- C. Brute-force attack
- D. Phishing attack

**Answer: C**

Explanation:

The scenario describes an automated, trial-and-error attempt that tries all possible combinations of usernames and passwords until a correct credential pair is found. This is the defining characteristic of a brute-force attack.

In digital forensics terminology, brute force is a direct password-guessing method that relies on exhaustive attempts (or systematically generated candidates) rather than tricking the user or exploiting a software flaw.

Investigators commonly recognize brute-force activity through artifacts such as repeated authentication failures in security logs, high-frequency login attempts from a single IP or distributed sources, account lockout events, and abnormal spikes in authentication traffic. In banking and web environments, it may also appear as repeated POST requests to login endpoints with varying credential pairs and consistent user-agent patterns, sometimes accompanied by throttling or CAPTCHA triggers.

The other options do not match the described "attempting all possible combinations" behavior.

Phishing obtains credentials by deception (fake emails/sites). A Trojan horse steals data by running malicious code on the victim's system. Data manipulation focuses on altering data integrity rather than credential guessing. Therefore, the correct attack type is Brute-force attack (A).

## NEW QUESTION # 19

.....

We provide you the free download and tryout of our 112-57 study tool before your purchase our product and we provide the demo of the product to let the client know our product fully. After you visit the pages of our 112-57 test torrent on the websites, you can know the characteristics and merits of the 112-57 Guide Torrent. In the pages of our product on the website, you can find the details and guarantee and the contact method, the evaluations of the client on our 112-57 test torrent and other information about our 112-57 exam questions. So it is very convenient for you.
