This allows candidates to choose the format that best suits their learning style and preference, ensuring a seamless and effective exam preparation experience. By offering tailored solutions to meet individual needs, ExamsLabs has established itself as a trusted provider of top-quality Splunk Enterprise Certified Architect (SPLK-2002) exam preparation material.

The SPLK-2002 Certification is a valuable asset for professionals looking to advance their careers in data analytics and IT operations. It provides a recognized standard of excellence in Splunk architecture and deployment, and can open up new opportunities for career growth and advancement.

Splunk SPLK-2002: Splunk Enterprise Certified Architect exam is a certification that validates the knowledge and skills of an individual in using Splunk Enterprise. Splunk is a software platform that enables organizations to search, analyze, and visualize data in real-time. Splunk Enterprise Certified Architect certification exam is designed to assess the candidate's ability to architect and deploy Splunk Enterprise environments efficiently.

Splunk Enterprise Certified Architect Sample Questions (Q155-Q160):

NEW QUESTION # 155

Which CLI command converts a Splunk instance to a license slave?

- A. splunk add licenses
- B. splunk edit licenser-localslave

- C. splunk list licenser-localslave
- D. splunk list licenser-slaves

Answer: B

Explanation:

Explanation

The splunk edit licenser-localslave command is used to convert a Splunk instance to a license slave. This command will configure the Splunk instance to contact a license master and receive a license from it. This command should be used when the Splunk instance is part of a distributed deployment and needs to share a license pool with other instances. The splunk add licenses command is used to add a license to a Splunk instance, not to convert it to a license slave. The splunk list licenser-slaves command is used to list the license slaves that are connected to a license master, not to convert a Splunk instance to a license slave. The splunk list licenser-localslave command is used to list the license master that a license slave is connected to, not to convert a Splunk instance to a license slave. For more information, see Configure license slaves in the Splunk documentation.

NEW QUESTION # 156

Which of the following artifacts are included in a Splunk diagfile? (Select all that apply.)

- A. Internal logs.
- B. Customer data.
- C. OS settings.
- D. Configuration files.

Answer: A,D

Explanation:

Explanation/Reference: <https://docs.splunk.com/Documentation/Splunk/7.3.2/Troubleshooting/Generateadiag>

NEW QUESTION # 157

Other than high availability, which of the following is a benefit of search head clustering?

- A. Input settings are synchronized between search heads.
- B. Automatic replication of user knowledge objects.
- C. Fewer network ports are required to be opened between search heads.
- D. Allows indexers to maintain multiple searchable copies of all data.

Answer: B

Explanation:

According to the Splunk documentation¹, one of the benefits of search head clustering is the automatic replication of user knowledge objects, such as dashboards, reports, alerts, and tags. This ensures that all cluster members have the same set of knowledge objects and can serve the same search results to the users.

The other options are false because:

* Allowing indexers to maintain multiple searchable copies of all data is a benefit of indexer clustering, not search head clustering².

* Input settings are not synchronized between search heads, as search head clusters do not collect data from inputs. Data collection is done by forwarders or independent search heads³.

* Fewer network ports are not required to be opened between search heads, as search head clusters use several ports for communication and replication among the members⁴.

NEW QUESTION # 158

Of the following types of files within an index bucket, which file type may consume the most disk?

- A. Rawdata
- B. Inverted index (.tsidx)
- C. Bloom filter
- D. Metadata (.data)

Answer: C

NEW QUESTION # 159

A customer has a Search Head Cluster (SHC) with site1 and site2. Site1 has five search heads and Site2 has four. Site1 search heads are preferred captains. What action should be taken on Site2 in a network failure between the sites?

- A. Disable elections and set a static captain, then restart the cluster.
- B. Disable elections and set a static captain, notifying all members.
- C. Set a dynamic captain manually and restart.
- **D. No action is required.**

Answer: D

Explanation:

Splunk's Search Head Clustering documentation explains that the cluster uses a majority-based election system. A captain is elected only when a node sees more than half of the cluster. In a two-site design where site1 has the majority of members, Splunk states that the majority site continues normal operation during a network partition. The minority site (site2) is not allowed to elect a captain and should not promote itself.

Splunk specifically warns administrators not to enable static captain on a minority site during a network split.

Doing so creates two independent clusters, leading to configuration divergence and severe data-consistency issues. The documentation emphasizes that static captain should only be used for a complete loss of majority, not for a site partition.

Because Site1 maintains majority, it remains the active cluster and site2 does not perform any actions. Splunk states that minority-site members should simply wait until network communication is restored.

Thus the correct answer is B: No action is required.
