## Cloud Security Alliance Certificate of Cloud Security Knowledge v5 (CCSKv5.0) Sample Questions (Q197-Q202):

### NEW QUESTION # 197

ENISA: "VM hopping" is:

- A. Lack of vulnerability management standards.
- B. Instability in VM patch management causing VM routing errors.
- C. Looping within virtualized routing systems.
- D. Improper management of VM instances, causing customer VMs to be commingled with other customer systems.
- E. Using a compromised VM to exploit a hypervisor, used to take control of other VMs.

**Answer: E**

### NEW QUESTION # 198

What should every cloud customer set up with its cloud service provider (CSP) that can be utilized in the event of an incident?

- A. A rainy day fund
- B. A spill remediation kit
- C. A data destruction plan
- D. A communication plan
- E. A back-up website

**Answer: D**

### NEW QUESTION # 199

Which cloud deployment model involves a cloud and a datacenter, bound together by technology to enable data and application portability?

- A. Public cloud
- B. Private cloud
- C. Hybrid cloud
- D. Multi-cloud

**Answer: C**

Explanation:

The hybrid cloud deployment model involves integrating a private cloud (or on-premises datacenter) with a public cloud, bound together by technology that enables data and application portability. This allows workloads to move seamlessly between environments, leveraging the benefits of both private and public clouds.

From the CCSK v5.0 Study Guide, Domain 1 (Cloud Computing Concepts and Architectures), Section 1.3:

"A hybrid cloud combines on-premises infrastructure (or a private cloud) with a public cloud, integrated through technology that allows data and application portability. This model enables organizations to maintain sensitive workloads on-premises while leveraging the scalability of public cloud services." Option A (Hybrid cloud) is the correct answer.

\* Option B (Public cloud) is incorrect because it involves only cloud provider resources, not a datacenter.

\* Option C (Multi-cloud) is incorrect because it refers to using multiple public cloud providers, not a datacenter.

\* Option D (Private cloud) is incorrect because it does not inherently include integration with a public cloud.

### NEW QUESTION # 200

In cloud services, risks and responsibilities are shared between the cloud provider and customer, however, which of the following holds true?

- A. Cloud Customer has ultimate legal liability for unauthorised and illicit data disclosures
- B. Cloud Customer liability is limited to financial responsibility
- C. Cloud provider has ultimate legal liability for unauthorised and illicit data disclosures
- D. Cloud Provider liability is limited to financial responsibility

**Answer: A**

Explanation:

In a shared responsibility model, Data security is responsibility of the cloud consumer and he is legally liable.

#### NEW QUESTION # 201

In the context of cloud security, which approach prioritizes incoming data logs for threat detection by applying multiple sequential filters?

- A. Streamlined single-filter method
- B. Parallel processing approach
- C. Unfiltered bulk analysis
- D. Cascade-and-filter approach

**Answer: D**

Explanation:

The Cascade-and-filter approach is a method used in cloud security to handle incoming data logs efficiently.

It prioritizes logs for threat detection by applying multiple sequential filters, where each filter progressively narrows down the data.

This approach helps in:

\* Layered threat detection: Early filters eliminate non-critical data, while subsequent filters perform more detailed analysis.

\* Efficient processing: Reduces the volume of data passed through advanced and resource-intensive filters.

\* Improved accuracy: Allows focusing on the most relevant security events.

For example, in a cloud environment, the first filter might check for known malicious IP addresses, the second might look for suspicious file types, and subsequent filters may perform behavioral analysis or anomaly detection.

Why Other Options Are Incorrect:

\* B. Parallel processing approach: This method processes logs simultaneously, not sequentially, and is less efficient for prioritizing threats.

\* C. Streamlined single-filter method: Uses a single filter for all data, which lacks depth and thoroughness in identifying complex threats.

\* D. Unfiltered bulk analysis: This approach is resource-intensive and inefficient, as it does not prioritize or filter logs.
