Term 40 1 of 57

A computer scientist is developing a new program that will process stock market data. The computer scientist is following the computer problem-solving process and just completed the analysis and specification phase.

Which phase is next in this process?

Give this one a go later!

Reliable WGU Practical Applications of Prompt QFO1 Practical-Applications-of-Prompt Dumps Questions and dumps ebook make your career more successful. WGU provides updated, free reliable WGU Practical Applications of Prompt QFO1 dumps free download. And the WGU Practical Applications of Prompt QFO1 WGU Practical Applications of Prompt QFO1 price is affordable. With 365 days updates. It works with all operating systems like Linux, Windows, Android, Mac, and IOS, etc.

All these three WGU Practical-Applications-of-Prompt exam questions formats contain the real and updated Practical-Applications-of-Prompt exam questions. These WGU Practical Applications of Prompt QFO1 (Practical-Applications-of-Prompt) exam questions are being presented in practice test software and PDF dumps file formats. The Practical-Applications-of-Prompt desktop practice test software is easy to use and install on your desktop computers. Whereas the other WGU Practical-Applications-of-Prompt web-based practice test software is concerned, this is a simple browser-based application that works with all operating systems. Both practice tests are customizable, simulate actual exam scenarios, and help you overcome mistakes.

## WGU Practical Applications of Prompt QFO1 Sample Questions (Q20-Q25):

### NEW QUESTION # 20

A person wants to use AI to make a technical document easier to comprehend. Which prompt engineering solution is most effective to achieve this goal?

- A. Give a list of appropriate words with the phrase "using these words"
- B. Ask the model to create another version with "read and summarize"
- C. **Include reading-level limitations with "at a tenth-grade reading level"**
- D. Correctly instruct the model with the keywords "translating" and "document"

**Answer: C**

Explanation:

The most effective way to optimize AI for clarity and comprehension is to include reading-level limitations.

While "summarizing" (Option B) shortens the text, it doesn't necessarily make the remaining language simpler. However, specifying a "tenth-grade reading level" (or "Explain it like I'm five") provides the AI with a very specific linguistic constraint. It forces the model to swap complex jargon for common synonyms, use shorter sentence structures, and avoid passive voice.

This technique is a form of Output Constraint. Reading levels are well-defined metrics that AI models can emulate because they have been trained on vast amounts of graded educational material. By setting this boundary, the user ensures the output is accessible to a broader audience without losing the core technical meaning. In practical professional settings—such as translating a medical white paper for a patient or a legal contract for a small business owner—this type of prompting is essential. It transforms dense, "impenetrable" text into actionable information, demonstrating how specific constraints can be used to reformat and simplify complex data sets effectively.

### NEW QUESTION # 21

A bank uses AI to detect fraud in financial transactions. What is the AI capability that enables this functionality?

- A. Identity verification
- **B. Pattern identification**
- C. Contextual understanding
- D. Misinformation identification

**Answer: B**

Explanation:

In the financial sector, the primary utility of AI for fraud detection is its superior ability for pattern identification. Financial transactions generate massive streams of data, most of which follow a predictable

"normal" pattern for any given user. AI models are trained to establish a baseline of these standard behaviors—such as typical spending amounts, geographical locations, and frequency of purchases. When a transaction occurs that deviates significantly from these established patterns, the AI flags it as potential fraud.

This process is fundamentally about detecting anomalies within a dataset. While identity verification and contextual understanding are useful in banking, they are sub-components or different processes entirely.

Pattern identification allows the system to analyze variables across millions of transactions simultaneously, identifying microscopic correlations that might suggest a stolen credit card or a sophisticated money-laundering scheme. Because fraudsters are constantly evolving their tactics, AI systems use machine learning to adapt to new patterns of illicit behavior. This capability is what makes AI an indispensable tool for real-time risk management, as it can process and evaluate the legitimacy of a transaction in milliseconds, a task that would be impossible for human auditors to perform at scale.

### NEW QUESTION # 22

What is one example of a task in which natural language processing (NLP) algorithms are employed?

- **A. Textual data cleaning**
- B. Increasing raw data precision

- C. Numerical data cleaning
- D. Interpreting raw values

**Answer: A**

Explanation:

Natural Language Processing (NLP) is a branch of AI that focuses on the interaction between computers and human language. One of its most practical and widespread applications is Textual data cleaning. When dealing with large datasets of unstructured text such as customer reviews, social media posts, or support tickets—the data is often "noisy," containing typos, slang, irrelevant HTML tags, or inconsistent formatting.

NLP algorithms are used to standardize this data through techniques like tokenization (breaking text into words), stemming or lemmatization (reducing words to their root form), and "stop word" removal (filtering out common words like "the" or "is" that don't add semantic value). This cleaning process is essential before any higher-level analysis, such as sentiment analysis or topic modeling, can take place. If the data isn't cleaned, the resulting AI model will be less accurate. Unlike "Numerical data cleaning" (Option D), which deals with outliers or missing values in numbers, textual data cleaning requires an understanding of linguistic rules and context, which is the core strength of NLP. Effective prompt engineering often involves asking an AI to perform these cleaning tasks to prepare a dataset for more complex reasoning or summarization.

**NEW QUESTION # 23**

Which activity is facilitated by natural language processing?

- A. Calculating numerical data statistics
- B. Managing parallel computing
- **C. Checking for grammar errors**
- D. Verifying experiment measurements

**Answer: C**

Explanation:

Checking for grammar errors is a quintessential NLP task. Modern grammar checkers (like Grammarly or the built-in tools in Word and ChatGPT) do not just look for misspelled words; they utilize NLP to understand the syntactic structure of a sentence. This allows the AI to identify complex issues such as subject-verb disagreement, dangling modifiers, and improper tense usage.

NLP models are trained on the rules of linguistics and large corpora of well-written text, allowing them to predict what a "correct" sentence should look like. This facilitates more than just mechanical correction; it allows the AI to suggest improvements in tone, clarity, and conciseness. Because the AI "understands" the relationship between different parts of speech, it can offer context-aware suggestions. For example, it can distinguish between "there," "their," and "they're" based on the surrounding words—a task that a simple spell-checker cannot do. This application is foundational to prompt engineering because users often use AI as an editor. By facilitating high-quality grammar and style checking, NLP allows for more professional communication and ensures that the final output of any prompt is polished and ready for a human audience.

**NEW QUESTION # 24**

Which prompting technique involves using information from an initial prompt to guide the AI to a second prompt?

- A. Least to most
- **B. Generated knowledge**
- C. Zero-shot
- D. Cognitive verifier pattern

**Answer: B**

Explanation:

The Generated Knowledge technique is a two-step optimization process. In the first step, the user asks the AI to generate a set of relevant facts, rules, or background information about a topic. In the second step, this newly "generated knowledge" is incorporated into a follow-up prompt to improve the accuracy of the final answer. This is particularly useful when the AI needs to perform a task that requires specific domain expertise that might not be immediately "top-of-mind" for the model.

For example, if you want the AI to write a medical summary, you might first ask it to "List the current guidelines for treating hypertension" (Generated Knowledge). Then, you use that list in a second prompt:

"Based on these guidelines, evaluate this patient's case." This technique prevents the AI from relying purely on its general training data and instead forces it to use a "grounded" set of facts as a reference point. It is a powerful way to reduce hallucinations because

the model is essentially building its own "contextual library" before attempting the main task. This sequential approach ensures that the final output is backed by explicit logic rather than just probabilistic word prediction.

## NEW QUESTION # 25
