The Certified Information Systems Security Professional (CISSP) PDF practice material contains actual ISC CISSP Exam Questions compiled by certified experts around the globe to benefit candidates. The criteria and pattern of the Certified Information Systems Security Professional (CISSP) exam often change, and hence it is essential to use the updated exam study material for preparation. Prep4cram provides free updates after purchase so that you get the latest ISC Exam Questions for the exam.

The CISSP certification is ideal for individuals who possess a minimum of five years of professional experience in the field of information security. Certified Information Systems Security Professional (CISSP) certification program is designed to help professionals develop a comprehensive understanding of the principles of information security and equip them with the knowledge and skillset necessary to become effective leaders in the field. Certified Information Systems Security Professional (CISSP) certification also demonstrates a professional's commitment to continuous learning and professional development, and is highly valued by employers around the world. With the growing need for information security professionals in today's digital landscape, the ISC CISSP certification is a valuable asset for anyone looking to advance their career in the field of information security.

## How to earn PCSA credentials?

The candidate must earn 50 continuing education units (CEUs) for the PCSA credential. The CEUs may be earned through participation in the ISSA - ISC2 Security Forum of Interest Community of Interest (COI), attendance at an Information Systems Security Association (ISSA) certified training course, obtaining CEUs from any other Information Systems Security Association or Information Systems Audit and Control Association (ISACA) member, obtaining certification credits for passing the exam, or through participating in many other online sites. The Professional level requires passing two exams to achieve. The PCSA credential is defined as conforming to the requirements of NCEES, the American Society for Testing and Materials (ASTM), and the International Information Systems Security Certification Consortium (ISC). The test will not earn a CISSP valid certification.

## ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q1475-Q1480):

### NEW QUESTION # 1475

An iterated block cipher encrypts by breaking the plaintext block into two halves and, with a subkey, applying a round transformation to one of the halves. Then, the output of this transformation is XORed with the remaining half. The round is completed by swapping the two halves. This type of cipher is known as:

- A. Diffie-Hellman
- B. Feistel
- C. RC6
- D. RC4

**Answer: B**

Explanation:

The question stem describes one round of a Feistel cipher. This algorithm was developed by an IBM team led by Horst Feistel. (h. Feistel,

Cryptography and Computer Privacy, Scientific American, v.228, n.5, May 1973) The algorithm was called Lucifer and was the basis for the Data Encryption Standard (DES). In answer a, RC4 is a variable keysize stream cipher developed by Ronald Rivest. In this type of cipher, a sequence of bits that are the key is bit-wise XORed with the plaintext.

\* Diffie-Hellman describes the first public key algorithm

and is based on the difficulty of calculating discrete logarithms in a finite field. (W. Diffie and M.e. Hellman, New Directions in Cryptography, IEEE Transactions on Information Theory, v. IT-22, n. 6, Nov

1976). It is used for exchanging keys. RC6, in answer c, is a fast block cipher designed by Rivest, Sidney and Yin. In RC6, the block size, the key size and the number of rounds are variable. The key size can be no larger than 2040 bits. RC6 was one of the five finalists in the Advanced Encryption Standard (AES) competition.

### NEW QUESTION # 1476

Which part of the 48-bit, 12-digit hexadecimal number known as the Media Access Control (MAC) address identifies the manufacturer of the

network device?

- A. The first two bytes
- B. The last three bytes
- C. The second half of the MAC address
- **D. The first three bytes**

**Answer: D**

Explanation:

The first three bytes (or first half) of the six-byte MAC address is the manufacturer's identifier (see Table). This can be a good troubleshooting aid if a network device is acting up, as it will isolate the brand of the failing device. The other answers are distracters. Source: Mastering Network Security by Chris Brenton (Sybex, 1999).

Common Vendors' MAC Addresses	
FIRST THREE BYTES	VENDOR
00000C	Cisco
0000A2	Bay Networks
0080D3	Shiva
00AA00	Intel
02608C	3COM
080007	Apple
080009	Hewlett-Packard 2®
080020	Sun
08005A	IBM

#### NEW QUESTION # 1477

In a multi-tenant cloud environment, what approach will secure logical access to assets?

- A. Hybrid cloud
- B. Transparency/Auditability of administrative access
- **C. Virtual private cloud (VPC)**
- D. Controlled configuration management (CM)

**Answer: C**

Explanation:

A virtual private cloud (VPC) is the logical division of a service provider's public cloud multi-tenant architecture to support private cloud computing.

#### NEW QUESTION # 1478

Which of the following is the MOST effective method of mitigating data theft from an active user workstation?

- A. Implement full-disk encryption
- B. Deploy file integrity checkers
- C. Enable multifactor authentication
- **D. Disable use of portable devices**

**Answer: D**

Explanation:

The most effective method of mitigating data theft from an active user workstation is to disable use of portable devices. Portable devices are the devices that can be easily connected to or disconnected from a workstation, such as USB drives, external hard drives, flash drives, or smartphones. Portable devices can pose a risk of data theft from an active user workstation, as they can be used to copy, transfer, or exfiltrate data from the workstation, either by malicious insiders or by unauthorized outsiders. By disabling use of portable devices, the data theft from an active user workstation can be prevented or reduced.

\* A. Implement full-disk encryption is not the most effective method of mitigating data theft from an active user workstation, but rather a method of mitigating data theft from a lost or stolen user workstation. Full-disk encryption is the process of transforming or encoding the entire data on a disk or a device into an unreadable or unintelligible form, using a secret key or algorithm. Full-disk encryption can protect the data from unauthorized access or disclosure if the disk or the device is lost or stolen, but it does not protect the data from unauthorized copying or transferring if the disk or the device is active and unlocked.

\* B. Enable multifactor authentication is not the most effective method of mitigating data theft from an active user workstation, but rather a method of mitigating unauthorized access or login to a user workstation. Multifactor authentication is the process of verifying the identity and the legitimacy of a user or a device by requiring two or more factors or methods of authentication, such as something the user knows (e.g., password, PIN, or security question), something the user has (e.g., token, card, or smartphone), or something the user is (e.g., fingerprint, face, or voice). Multifactor authentication can prevent or reduce unauthorized access or login to a user workstation, but it does not prevent or reduce data theft from an active user workstation, especially by malicious insiders who have legitimate access or login credentials.

\* C. Deploy file integrity checkers is not the most effective method of mitigating data theft from an active user workstation, but rather a method of detecting data tampering or corruption on a user workstation.

File integrity checkers are the software tools or applications that monitor and verify the integrity or the authenticity of the files or the programs on a workstation, by using cryptographic techniques, such as hashing, digital signatures, or certificates. File integrity checkers can detect data tampering or corruption on a user workstation, but they cannot prevent or reduce data theft from an active user workstation, as they do not prevent or restrict data copying or transferring.
