Realistic Data-Architect Real Brindumps by Itcerttest

Users of Itcerttest software can attempt multiple Salesforce Certified Data Architect (Data-Architect) practice exams to assess and improve preparation for the examination. Customers can view their previous attempts' scores and see their mistakes. It helps test takers take the final Salesforce Certified Data Architect (Data-Architect) exam without making mistakes. The web-based version of the Data-Architect practice exam can be taken online. It means you can take this mock test via any browser like MS Edge, Firefox, Chrome, Internet Explorer, and Safari.

Salesforce Certified Data Architect Sample Questions (Q46-Q51):

NEW QUESTION # 46

UC is having issues using Informatica Cloud Louder to export +10M Order records. Each Order record has 10 Order Line Items. What two steps can you take to help correct this? Choose two answers.

- A. Export Bulk API in parallel mode
- B. Use PK Chunking
- C. Export in multiple batches
- D. Limit Batch to 10K records

Answer: B,C

NEW QUESTION # 47

Which three characteristics of a skinny table help improve report and query performance?

- A. Skinny tables provide a view across multiple objects for easy access to combined data.
- **B. Skinny tables can contain frequently used fields and thereby help avoid joins.**
- **C. Skinny tables do not include records that are available in the recycle bin.**
- **D. Skinny tables are kept in sync with changes to data in the source tables.**
- E. Skinny tables can be used to create custom indexes on multi-select picklist fields.

Answer: B,C,D

Explanation:

The three characteristics of a Skinny table that help improve report and query performance are: Skinny tables can contain frequently used fields and thereby help avoid joins. Skinny tables are kept in sync with changes to data in the source tables. Skinny tables do not include records that are available in the recycle bin. These characteristics are beneficial because they reduce the query complexity and execution time, and improve the data accuracy and freshness. For example, skinny tables can contain frequently used fields from multiple objects, such as Account and Contact, and thereby help avoid joins that can slow down queries⁴. Skinny tables are updated automatically when the source tables are modified, so they always reflect the latest data⁵. Skinny tables do not include records that are available in the recycle bin, so they only contain active records that are relevant for reports and queries.

NEW QUESTION # 48

UC is rolling out Sales App globally to bring sales teams together on one platform. UC expects millions of opportunities and accounts to be created and is concerned about the performance of the application.

Which 3 recommendations should the data architect make to avoid the data skew? Choose 3 answers.

- A. Use picklist fields rather than lookup to custom object.
- **B. Limit associating 10000 records looking up to same records.**
- **C. Limit associating 10000 opportunities to one account.**
- **D. Limit assigning one user 10000 records ownership.**
- E. Assign 10000 opportunities to one account.

Answer: B,C,D

Explanation:

Data skew occurs when a large number of child records are associated with a single parent record, or when a single user owns a large number of records. This can cause performance issues and lock contention. To avoid data skew, the data architect should limit assigning one user 10,000 records ownership, limit associating 10,000 opportunities to one account, and limit associating 10,000 records looking up to the same record.

NEW QUESTION # 49

Universal Containers (UC) has a multi-level master-detail relationship for opportunities, a custom opportunity line item object, and a custom discount request. UC has opportunity as master and custom line item object as detail in master-detail relationship. UC also has a custom line item object as master and a custom discount request object as detail in another master-detail relationship. UC has a requirement to show all sums of discounts across line items at an opportunity level. What is the recommended solution to address these requirements?

- **A. Roll-up discount request amount at the line-item-level and line-item-level summary discount at the opportunity level.**
- B. Update the master-detail relationships to lookup relationships in order to allow the discount amount to roll up.
- C. Use roll-up for the line-item-level summary and a trigger for the opportunity amount summary, as only one level roll-up is allowed.
- D. Remove the master-detail relationships and rely completely on workflow/triggers to summarize the discount amount.

Answer: A

Explanation:

The recommended solution to address the requirements of Universal Containers (UC) is to roll-up discount request amount at the

line-item-level and line-item-level summary discount at the opportunity level. This solution would allow UC to show all sums of discounts across line items at an opportunity level using standard roll-up summary fields. Since UC has a multi-level master-detail relationship for opportunities, a custom opportunity line item object, and a custom discount request object, they can use two levels of roll-up summary fields to aggregate the discount amounts from the child objects to the parent objects. For example, they can create a roll-up summary field on the custom line item object to sum up the discount request amounts from the custom discount request object. Then, they can create another roll-up summary field on the opportunity object to sum up the line-item-level summary discounts from the custom line item object.

NEW QUESTION # 50

A casino is implementing salesforce and is planning to build a customer 360 view for a customer who visits its resorts. The casino currently maintained the following systems that records customer activity:

1. Point of sales system: All purchases for a customer.
2. Salesforce: All customer service activity and sales activity for a customer.
3. Mobile app: All bookings, preferences and browser activity for a customer.
4. Marketing: All email, SMS and social campaigns for a customer.

Customer service agents using salesforce would like to view the activities from all system to provide supports to customers. The information has to be current and real time.

What strategy should the data architect implement to satisfy this requirement?

- **A. Explore external data sources in salesforce to build 360 view of customer.**
- B. Migrate customer activities from all 4 systems into salesforce.
- C. Periodically upload summary information in salesforce to build 360 view.
- D. Use a customer data mart to view the 360 view of customer.

Answer: A

Explanation:

Exploring external data sources in Salesforce to build 360 view of customer is the best strategy to satisfy the requirement, as it allows real-time access to data from other systems without storing it in Salesforce3. Using a customer data mart may not provide real-time information or may require additional integration efforts. Migrating customer activities from all 4 systems into Salesforce may exceed the storage limits or cause data quality issues. Periodically uploading summary information in Salesforce may not provide current or detailed information.

NEW QUESTION # 51

.....

Data-Architect is the authentic study guides with the latest exam material which can help you solve all the difficulties in the actual test. Our Data-Architect free demo is available for all of you. You will receive an email attached with the Data-Architect training dumps within 5-10 minutes after completing purchase. Immediately download for the Data-Architect study pdf is available for study with no time wasted. We have money refund policy to ensure your interest in case the failure of Data-Architect actual test.
