WGU Data Management – Foundations Exam Sample Questions (Q46-Q51):

NEW QUESTION # 46

Which syntax feature classifies the explicit string, numeric, or binary values used in SQL queries?

- A. Keywords
- **B. Literals**
- C. Comments
- D. Identifiers

Answer: B

Explanation:

In SQL, literals represent explicit values such as numbers, strings, or binary data directly written into queries.

For example:

```
SELECT * FROM Employees WHERE Salary > 50000;
```

Here, 50000 is a numeric literal.

* Option A (Correct): Literals are explicit values used in SQL queries, such as 123, 'John Doe', and TRUE.

* Option B (Incorrect): Comments are non-executable text used for documentation within SQL code, typically denoted by -- or /* ... */.

* Option C (Incorrect): Identifiers are names of tables, columns, or other database objects, such as EmployeeID.

* Option D (Incorrect): Keywords are reserved words in SQL (e.g., SELECT, FROM, WHERE) that define operations and syntax.

NEW QUESTION # 47

Which keyword or clause indicates the desired sequence when displaying a set of records returned from a SELECT statement?

- A. LIKE
- **B. ORDER BY**
- C. DISTINCT
- D. BETWEEN

Answer: B

Explanation:

The ORDER BY clause in SQL is used to sort query results in ascending (ASC) or descending (DESC) order.

Example Usage:

```
sql
```

```
SELECT Name, Salary FROM Employees ORDER BY Salary DESC;
```

* This retrieves all employees, sorted by salary in descending order.

Why Other Options Are Incorrect:

* Option A (BETWEEN) (Incorrect): Used for filtering ranges but does not order results.

* Option B (DISTINCT) (Incorrect): Removes duplicate rows but does not control order.

* Option D (LIKE) (Incorrect): Used for pattern matching, not sorting.

Thus, ORDER BY is the correct choice for defining the sequence of query results.

NEW QUESTION # 48

Which clause from a SELECT statement immediately accompanies the SELECT clause in MySQL?

- A. TABLE

- B. WHERE
- C. VALUE
- D. FROM

Answer: D

Explanation:

In SQL syntax, the FROM clause is the first clause that follows SELECT. It specifies the table(s) from which the data will be retrieved.

Example:

sql

SELECT name, salary FROM Employees;

- * Option A (Correct): The FROM clause immediately follows the SELECT clause in MySQL.
- * Option B (Incorrect): VALUE is not a valid clause in MySQL SELECT statements.
- * Option C (Incorrect): WHERE is used to filter records after specifying the table in FROM.
- * Option D (Incorrect): TABLE is not a valid clause following SELECT in SQL.

NEW QUESTION # 49

Which capability should databases maintain to simplify the use of SQL with a general-purpose language?

- A. The use of an application programming interface
- B. The query processor to deliver results
- C. The storage manager to interpret low-level file-system commands
- D. The ability to reverse results if needed

Answer: A

Explanation:

Databases need to support Application Programming Interfaces (APIs) to enable seamless integration with general-purpose programming languages like Python, Java, and C#. APIs like ODBC (Open Database Connectivity) and JDBC (Java Database Connectivity) allow applications to interact with databases without requiring complex SQL commands.

- * Option A (Incorrect): The storage manager is responsible for managing low-level file system operations, but it does not simplify SQL integration with programming languages.
- * Option B (Incorrect): The ability to reverse results (e.g., using ORDER BY DESC) is a SQL feature but is unrelated to integration with programming languages.
- * Option C (Incorrect): The query processor optimizes and executes SQL queries but does not provide an interface for application development.
- * Option D (Correct): APIs allow databases to be accessed easily from different programming environments, simplifying integration.

NEW QUESTION # 50

Which main characteristic is used to differentiate between strong and weak entities in the process of database design?

- A. Cardinality
- B. Association
- C. Foreign key
- D. Primary key

Answer: D

Explanation:

In database design, an entity is classified as strong or weak based on whether it has a primary key that uniquely identifies its records.

Differences Between Strong and Weak Entities:

Entity Type	Primary Key	Example
Strong Entity	Has its own unique primary key	Student (StudentID)
Weak Entity	Does not have a primary key of its own; depends on another table's key	OrderDetails (Depends on OrderID)

```
CREATE TABLE Orders (
OrderID INT PRIMARY KEY,
CustomerID INT
);
CREATE TABLE OrderDetails (
OrderDetailID INT,
OrderID INT,
ProductID INT,
PRIMARY KEY (OrderDetailID, OrderID),
FOREIGN KEY (OrderID) REFERENCES Orders(OrderID)
);
```

- * Orders is a strong entity (has OrderID as its own primary key).
- * OrderDetails is a weak entity (depends on OrderID for uniqueness).

Why Other Options Are Incorrect:

- * Option A (Association) (Incorrect): Associations describe relationships but do not define strong/weak entities.
- * Option C (Foreign key) (Incorrect): Weak entities depend on foreign keys, but primary keys define their status.
- * Option D (Cardinality) (Incorrect): Cardinality defines relationship constraints but does not differentiate entity types.

Thus, the correct answer is Primary key, as it is the defining characteristic between strong and weak entities.
