## WGU Data Management – Foundations Exam Sample Questions (Q50-Q55):

### NEW QUESTION # 50

What is the role of the transaction manager within the database system architecture?

- A. The transaction manager is composed of a query processor, storage manager, transaction manager, log, and catalog.
- B. The transaction manager uses information from the catalog to perform query optimization.
- C. The transaction manager translates the query processor instructions into filesystem commands and uses an index to quickly locate the requested data.
- **D. The transaction manager logs insert, update, and delete queries, and the result is sent back to the application.**

**Answer: D**

Explanation:

A Transaction Manager ensures ACID (Atomicity, Consistency, Isolation, Durability) properties in database transactions. It manages concurrent transactions, ensuring no conflicts occur and logs modifications to support recovery mechanisms.

\* Option A (Incorrect): Query optimization is managed by the query processor, not the transaction manager.

\* Option B (Incorrect): The transaction manager is a component of the database architecture but is not composed of the entire system (query processor, storage manager, etc.).

\* Option C (Correct): The transaction manager logs transactions like INSERT, UPDATE, and DELETE, ensuring consistency and recoverability.

\* Option D (Incorrect): The storage manager is responsible for translating queries into filesystem commands.

### NEW QUESTION # 51

Which object relates an entity to itself in an entity-relationship model?

- A. Repository
- B. Attribute
- **C. Reflexive relationship**
- D. Relationship instance

**Answer: C**

Explanation:

A reflexive relationship (also called unary relationship) occurs when an entity is related to itself.

Example Usage:

A screenshot of a computer AI-generated content may be incorrect.

EmployeeID	Name	ManagerID (FK)
1	Alice	NULL
2	Bob	1
3	Carol	1

```
CREATE TABLE Employees (  
  EmpID INT PRIMARY KEY,  
  Name VARCHAR(50),  
  ManagerID INT,  
  FOREIGN KEY (ManagerID) REFERENCES Employees(EmpID)  
);
```

\* ManagerID refers to another employee within the same table.

Why Other Options Are Incorrect:

\* Option A (Repository) (Incorrect): A data storage structure, not a relationship type.

\* Option B (Relationship instance) (Incorrect): Describes a specific connection between entities, not a reflexive relationship.

\* Option D (Attribute) (Incorrect): Attributes store characteristics, but do not define relationships.

Thus, the correct answer is Reflexive relationship, as it relates an entity to itself.

### NEW QUESTION # 52

Which term defines a column, or group of columns, that refers to a primary key in a different table?

- A. Simple key
- B. Composite key
- C. Foreign key
- D. Super key

**Answer: C**

Explanation:

A foreign key is a column (or a set of columns) that establishes a relationship between two tables by referencing the primary key of another table.

Example Usage:

sql

```
CREATE TABLE Departments (  
  DeptID INT PRIMARY KEY,  
  DeptName VARCHAR(50)  
);  
CREATE TABLE Employees (  
  EmpID INT PRIMARY KEY,  
  Name VARCHAR(50),  
  DeptID INT,  
  FOREIGN KEY (DeptID) REFERENCES Departments(DeptID)  
);
```

\* DeptID in Employees is a foreign key, referencing DeptID in Departments.

\* Ensures referential integrity # DeptID in Employees must exist in Departments.

Why Other Options Are Incorrect:

\* Option A (Super key) (Incorrect): A super key is any set of columns that uniquely identifies a row, but it does not reference another table.

\* Option B (Simple key) (Incorrect): A simple key is a single-column primary key, not a reference to another table.

\* Option C (Composite key) (Incorrect): A composite key consists of multiple columns but does not necessarily reference another table.

Thus, the correct answer is Foreign key, as it establishes a connection between two tables.

### NEW QUESTION # 53

Which keyword can be used as a clause in an ALTER TABLE statement?

- A. AGGREGATE
- B. CHANGE
- C. STOP
- D. DELETE

**Answer: B**

Explanation:

The ALTER TABLE statement is used to modify an existing database table structure. One common clause is CHANGE, which allows renaming a column and modifying its data type.

Example:

sql

```
ALTER TABLE Employees CHANGE COLUMN OldName NewName VARCHAR(50);
```

\* Option A (Incorrect): DELETE is used to remove rows, not alter table structure.

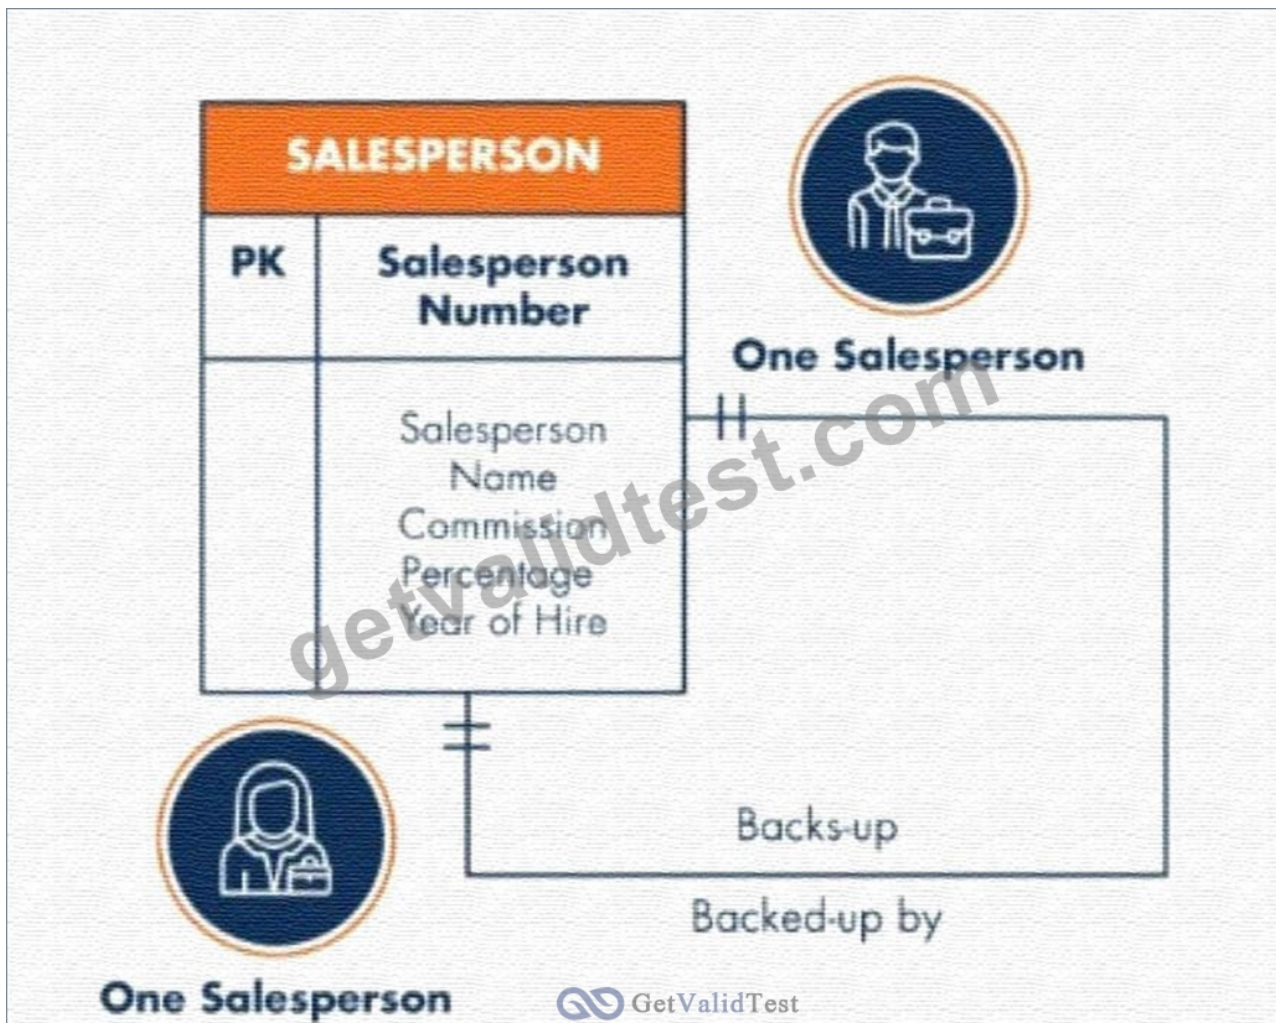

\* Option B (Correct): CHANGE is a valid clause for renaming and modifying columns in MySQL and some other databases.

\* Option C (Incorrect): STOP is not a valid SQL keyword for altering tables.

\* Option D (Incorrect): AGGREGATE refers to functions like SUM() and AVG(), not table alterations.

### NEW QUESTION # 54

Which relationship is shown in the following diagram?

- A. Associative entity
- **B. Unary relationship**
- C. Intersection data
- D. Many-to-many

**Answer: B**

Explanation:

The given diagram represents a unary relationship (also called a recursive relationship), which occurs when an entity is related to itself. In this case, salespersons back each other up, meaning a salesperson is associated with another salesperson from the same entity.

Key Observations from the Diagram:

- \* Single Entity (Salesperson)
- \* The table contains only one entity type, Salesperson, which has attributes such as Salesperson Number, Name, Commission, Percentage, and Year of Hire.
- \* Self-Referencing Relationship (Backs-up and Backed-up by)
- \* The diagram shows that a salesperson can back up another salesperson.
- \* This means that the relationship exists within the same entity rather than between two different entities.
- \* Cardinality (One-to-One Relationship in a Unary Form)
- \* The notation (|-|) in the ER diagram indicates a one-to-one recursive relationship.
- \* One salesperson can back up only one other salesperson, and each salesperson is backed up by only one.
