Pass4guide provides you not only with the best materials and also with excellent service. If you buy Pass4guide questions and answers, free update for one year is guaranteed. So, you can always have the latest test materials. You fail, after you use our Databricks Databricks-Certified-Data-Analyst-Associate Dumps, 100% guarantee to FULL REFUND. With it, what do you worry about? Pass4guide has a lot of confidence in our dumps and you also faith in our Pass4guide. In order to success, don't miss Pass4guide. If you miss Pass4guide, you will miss a chance to embrace the success.

You can also become part of this skilled and qualified community. To do this just enroll in the Databricks Certified Data Analyst Associate Exam and start preparation with real and valid Databricks-Certified-Data-Analyst-Associate practice test questions right now. The Databricks Certified Data Analyst Associate Exam practice test questions are checked and verified by experienced and qualified Databricks-Certified-Data-Analyst-Associate Exam trainers. So you can trust Pass4guide Databricks Certified Data Analyst Associate Exam practice test questions and start preparation with confidence.

Free PDF Reliable Databricks - Databricks-Certified-Data-Analyst-Associate Exam Consultant

By years of diligent work, our experts have collected the frequent-tested knowledge into our Databricks-Certified-Data-Analyst-Associate practice materials for your reference. By resorting to our Databricks-Certified-Data-Analyst-Associate study guide, we can absolutely reap more than you have imagined before. We have clear data collected from customers who chose our Databricks-Certified-Data-Analyst-Associate Actual Exam, the passing rate is 98-100 percent. So your chance of getting success will be increased greatly by our Databricks-Certified-Data-Analyst-Associate learning quiz.

Databricks Certified Data Analyst Associate Exam Sample Questions (Q20-

Q25):

NEW QUESTION # 20

A data analyst created and is the owner of the managed table `my_ table`. They now want to change ownership of the table to a single other user using Data Explorer.

Which of the following approaches can the analyst use to complete the task?

- A. Edit the Owner field in the table page by selecting All Users
- B. Edit the Owner field in the table page by removing their own account
- C. Edit the Owner field in the table page by removing all access
- D. Edit the Owner field in the table page by selecting the Admins group
- E. Edit the Owner field in the table page by selecting the new owner's account

Answer: E

Explanation:

The Owner field in the table page shows the current owner of the table and allows the owner to change it to another user or group. To change the ownership of the table, the owner can click on the Owner field and select the new owner from the drop-down list. This will transfer the ownership of the table to the selected user or group and remove the previous owner from the list of table access control entries¹. The other options are incorrect because:

A) Removing the owner's account from the Owner field will not change the ownership of the table, but will make the table ownerless².

B) Selecting All Users from the Owner field will not change the ownership of the table, but will grant all users access to the table³.

D) Selecting the Admins group from the Owner field will not change the ownership of the table, but will grant the Admins group access to the table³.

E) Removing all access from the Owner field will not change the ownership of the table, but will revoke all access to the table⁴.

Reference:

1: Change table ownership

2: Ownerless tables

3: Table access control

4: Revoke access to a table

NEW QUESTION # 21

A stakeholder has provided a data analyst with a lookup dataset in the form of a 50-row CSV file. The data analyst needs to upload this dataset for use as a table in Databricks SQL.

Which approach should the data analyst use to quickly upload the file into a table for use in Databricks SQL?

- A. Create a table by uploading the file to cloud storage and then importing the data to Databricks.
- B. Create a table by uploading the file using the Create page within Databricks SQL
- C. Create a table via a connection between Databricks and the desktop facilitated by Partner Connect.
- D. Create a table by manually copying and pasting the data values into cloud storage and then importing the data to Databricks.

Answer: B

Explanation:

Databricks provides a user-friendly interface that allows data analysts to quickly upload small datasets, such as a 50-row CSV file, and create tables within Databricks SQL. The steps are as follows:

Access the Data Upload Interface:

In the Databricks workspace, navigate to the sidebar and click on New > Add or upload data.

Select Create or modify a table.

Upload the CSV File:

Click on the browse button or drag and drop the CSV file directly onto the designated area.

The interface supports uploading up to 10 files simultaneously, with a total size limit of 2 GB.

Configure Table Settings:

After uploading, a preview of the data is displayed.

Specify the table name, select the appropriate schema, and configure any additional settings as needed.

Create the Table:

Once all configurations are set, click on the Create Table button to finalize the process.

This method is efficient for quickly importing small datasets without the need for additional tools or complex configurations. Options

B, C, and D involve more complex or manual processes that are unnecessary for this task.

NEW QUESTION # 22

Which of the following describes how Databricks SQL should be used in relation to other business intelligence (BI) tools like Tableau, Power BI, and Looker?

- A. As a complete replacement with additional functionality
- B. As an exact substitute with the same level of functionality
- C. As a substitute with less functionality
- D. As a complementary tool for professional-grade presentations
- E. As a complementary tool for quick in-platform BI work

Answer: E

Explanation:

Databricks SQL is not meant to replace or substitute other BI tools, but rather to complement them by providing a fast and easy way to query, explore, and visualize data on the lakehouse using the built-in SQL editor, visualizations, and dashboards. Databricks SQL also integrates seamlessly with popular BI tools like Tableau, Power BI, and Looker, allowing analysts to use their preferred tools to access data through Databricks clusters and SQL warehouses. Databricks SQL offers low-code and no-code experiences, as well as optimized connectors and serverless compute, to enhance the productivity and performance of BI workloads on the lakehouse. Reference: Databricks SQL, Connecting Applications and BI Tools to Databricks SQL, Databricks integrations overview, Databricks SQL: Delivering a Production SQL Development Experience on the Lakehouse

NEW QUESTION # 23

Which of the following layers of the medallion architecture is most commonly used by data analysts?

- A. Gold
- B. Bronze
- C. Silver
- D. All of these layers are used equally by data analysts
- E. None of these layers are used by data analysts

Answer: A

Explanation:

The gold layer of the medallion architecture contains data that is highly refined and aggregated, and powers analytics, machine learning, and production applications. Data analysts typically use the gold layer to access data that has been transformed into knowledge, rather than just information. The gold layer represents the final stage of data quality and optimization in the lakehouse. Reference: What is the medallion lakehouse architecture?

NEW QUESTION # 24

A data engineer is working with a nested array column `products` in table `transactions`. They want to expand the table so each unique item in `products` for each row has its own row where the `transaction_id` column is duplicated as necessary.

They are using the following incomplete command:

```
SELECT
  transaction_id,
  AS product
FROM transactions;
```

Which of the following lines of code can they use to fill in the blank in the above code block so that it successfully completes the task?

- A. `reduce(products)`
- B. `array(products)`
- C. `explode(products)`
- D. `flatten(products)`
- E. `array_distinct(products)`

Answer: C

Explanation:

The explode function is used to transform a DataFrame column of arrays or maps into multiple rows, duplicating the other column's values. In this context, it will be used to expand the nested array column products in the transactions table so that each unique item in products for each row has its own row and the transaction_id column is duplicated as necessary. Reference: Databricks

Documentation I also noticed that you sent me an image along with your message. The image shows a snippet of SQL code that is incomplete. It begins with "SELECT" indicating a query to retrieve data. "transaction_id," suggests that transaction_id is one of the columns being selected. There are blanks indicated by underscores where certain parts of the SQL command should be, including what appears to be an alias for a column and part of the FROM clause. The query ends with "FROM transactions;" indicating data is being selected from a 'transactions' table.
