EMC Dell Unity Deploy 2023 Exam Sample Questions (Q34-Q39):

NEW QUESTION # 34

Which two actions are recommended according to best practices when connecting iSCSI host to a Dell Unity XT system? (Choose two.)

- A. Use private network for iSCSI interfaces.
- B. Use standard NIC for iSCSI.
- C. Interfaces should be on separate subnets.
- D. Manually register host on storage array.

Answer: A,C

Explanation:

Two actions that are recommended according to best practices when connecting iSCSI host to a Dell Unity XT system are to ensure that the interfaces are on separate subnets and to use a private network for iSCSI interfaces. These actions can improve the performance, security, and availability of the iSCSI network.

Having interfaces on separate subnets can prevent broadcast storms, reduce network congestion, and enable multipathing. Using a private network for iSCSI interfaces can isolate the iSCSI traffic from other network traffic, reduce the risk of interference or attacks, and simplify the network configuration. Manually registering host on storage array and using standard NIC for iSCSI are not recommended actions, as they can introduce errors, inefficiencies, and limitations.

NEW QUESTION # 35

A storage administrator must configure replication from a production Dell Unity XT 680F to an offsite DR Dell Unity XT 480. Block resources must be replicated without data loss if the production site becomes unavailable. File resources can be replicated with an acceptable amount of data difference on the destination.

What replication configuration meets the requirements?

- A. Configure the replication connection mode to Both.
- B. Configure the replication interfaces on the 4-port mezzanine card.
- C. Set an RPO of 0 on the synchronous replication sessions.
- D. Set Unisphere resource filtering to All.

Answer: A

Explanation:

To meet the requirements, the replication connection mode must be set to Both, which allows both synchronous and asynchronous replication sessions to be configured on the same connection. This way, block resources can use synchronous replication, which ensures zero data loss, and file resources can use asynchronous replication, which allows some data difference on the destination. Setting Unisphere resource filtering to All is not necessary, as it only affects the display of resources in the Unisphere GUI. Setting an RPO of 0 on the synchronous replication sessions is redundant, as synchronous replication always has an RPO of 0. Configuring the replication interfaces on the 4-port mezzanine card is not relevant, as it only affects the performance and availability of the replication network.

NEW QUESTION # 36

Which task must be performed on the storage system in order to access a file system read/write snapshot?

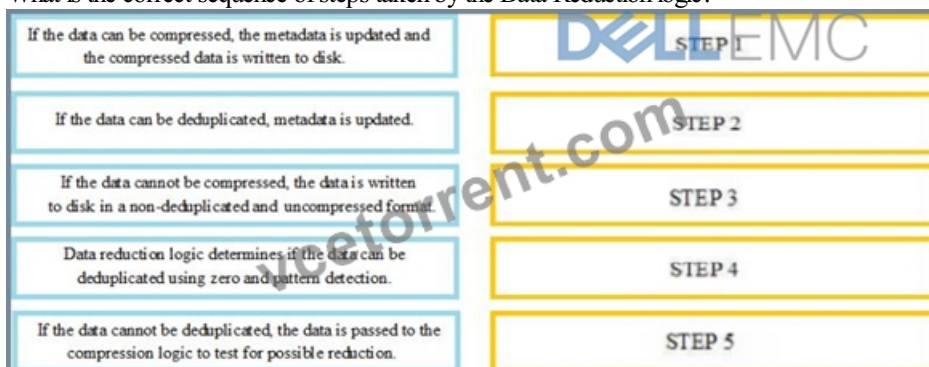

- A. Perform the snapshot "Attach to Host" operation
- B. Configure the NFS/SMB share to the file system snapshot
- C. Configure Host Access to the LUN snapshots
- D. Connect to the NFS/SMB share of the snapshot

Answer: B

NEW QUESTION # 37

The cache has sent data to the Data Reduction logic during proactive cleaning or flushing.

What is the correct sequence of steps taken by the Data Reduction logic?

Answer:

Explanation:

If the data can be compressed, the metadata is updated and the compressed data is written to disk.	Data reduction logic determines if the data can be deduplicated using zero and pattern detection.
If the data can be deduplicated, metadata is updated.	If the data can be deduplicated, metadata is updated.
If the data cannot be compressed, the data is written to disk in a non-deduplicated and uncompressed format.	If the data cannot be deduplicated, the data is passed to the compression logic to test for possible reduction.
