Our 1z0-076 training materials are designed to help users consolidate what they have learned, will add to the instant of many training, the user can test their learning effect in time after finished the part of the learning content, have a special set of wrong topics in our 1z0-076 guide torrent, enable users to find their weak spot of knowledge in this function, iterate through constant practice, finally reach a high success rate. As a result, our 1z0-076 study questions are designed to form a complete set of the contents of practice can let users master knowledge to pass the 1z0-076 exam.

## Oracle 1z0-076 Exam Syllabus Topics:

| Topic | Details |
|---|---|
| Topic 2 | • Managing Oracle Net Services in a Data Guard Environment: The section focuses on Oracle Net Services and its role in Data Guard networking setup. |
| Topic 3 | • Performing Role Transitions: Here, the concept of database roles is explained, along with the steps for performing switchovers, failovers, and maintaining physical standby sessions during role transitions. |
| Topic 4 | • Creating a Logical Standby Database: This topic guides users through the process of creating and managing a logical standby database, including SQL Apply filtering. |
| Topic 5 | • Using Flashback Database in a Data Guard Configuration: This topic covers the configuration and advantages of using Flashback Database in a Data Guard setup, as well as the process of enabling fast-start failover for seamless role changes. |

| Topic 6 | • Oracle Data Guard Broker Basics: An overview of the Data Guard broker, its architecture, components, benefits, and configurations, is provided here. It serves as an introduction to the tool used for managing Data Guard configurations. |
|---|---|
| Topic 7 | • Creating a Data Guard Broker Configuration: This section delves into the practical aspects of creating and managing a Data Guard broker configuration, including command-line and Enterprise Manager approaches. |
| Topic 8 | • Oracle Data Guard Basics: This topic covers the essential architecture and concepts of Oracle Data Guard. It includes sub-topics such as the physical and logical standby database comparison, benefits of Data Guard, and its integration with multi-tenant databases. |
| Topic 9 | • Using Oracle Active Data Guard: Supported Workloads in Read-Only Standby Databases: Here, the usage of physical standby databases for real-time queries is discussed. |

Our company concentrates on relieving your pressure of preparing the 1z0-076 exam. Getting the certificate equals to embrace a promising future and good career development. Perhaps you have heard about our 1z0-076 exam question from your friends or news. Why not has a brave attempt? You will certainly benefit from your wise choice. Now our 1z0-076 practice materials have won customers' strong support. Our sales volume is increasing every year. The great achievements benefit from our enormous input. First of all, we have done good job on researching the new version of the 1z0-076 exam question.

# Oracle Database 19c: Data Guard Administration Sample Questions (Q96-Q101):

**NEW QUESTION # 96**
Which two factors can cause an increase in redo transport lag?

- A. Increase in network latency between the primary database and a redo transport destination.
- B. Increase in redo generation rate on the primary database.
- C. The size of the standby redo log files on the primary database.
- D. The size of the online redo log files on the standby database.
- E. The size of the online redo log files on the primary database.

**Answer: A,B**

**NEW QUESTION # 97**
Examine the Data Guard configuration:

```
DGMGRL> show configuration;

Configuration - Animals

  Protection Mode: MaxAvailability

  Databases:
  dogs  - Primary database
    cats  - Physical standby database
    sheep - Physical standby database

Fast-Start Failover: DISABLED

Configuration Status:

ORA-01034: ORACLE not available
ORA-16625: cannot reach database "dogs"
DGM-17017: unable to determine configuration status
```

Which three will be true after a successful failover to Cats?

- A. The configuration will be in Maximum Performance mode.
- B. Sheep will be in the disabled state.
- C. The configuration will be in Maximum Availability mode.
- D. Sheep will be in the enabled state.
- E. Dogs will be in the disabled state and has to be manually reinstated.

**Answer: C,D,E**

Explanation:
After a successful failover to the 'cats' database in a Data Guard configuration:
* B: Sheep, being another standby database, would typically remain in the enabled state unless specifically disabled or if there was a configuration issue.
* D: Dogs, which was the primary database prior to failover, will be in a disabled state as part of the failover process. Manual intervention is required to re-establish 'dogs' as a standby database or to return it to the primary role through another role transition.
* E: If the configuration was in Maximum Availability mode before failover, it would remain in this mode after failover, provided all settings were properly configured and no changes were made to the protection mode.
Option A is incorrect because failover does not automatically change the protection mode to Maximum Performance. The protection mode remains as it was prior to the failover unless manually altered.
References: The behavior of Oracle Data Guard during failover and the resulting configuration state is described in the Oracle Data Guard Broker documentation.

**NEW QUESTION # 98**
Which TWO are benefits of using Transaction Guard in a Data Guard environment?

- A. It provides application continuity by rolling back uncommitted transactions interrupted by a failover or switchover.
- B. It protects against user errors being replicated to standby databases.
- C. It protects against logical corruptions being replicated to standby databases.
- D. It protects against recoverable errors during a planned or an unplanned outage of a primary database.
- E. It provides application continuity by replaying transactions interrupted by a failover or a switchover

**Answer: A,D**

Explanation:
Transaction Guard provides benefits in terms of transaction consistency and recovery in a Data Guard environment:
* It provides application continuity by rolling back uncommitted transactions interrupted by a failover or switchover (B): Transaction Guard ensures that any uncommitted transactions at the time of an outage are rolled back consistently, thus preserving the integrity of the application's data and state.
* It protects against recoverable errors during a planned or an unplanned outage of a primary database (D): Transaction Guard offers protection against errors that can occur during outages, allowing applications to resume operations more quickly and reliably after recovery.References:

**NEW QUESTION # 99**
Which THREE are true about using flashback database in a Data Guard environment?

- A. It may not be used to flash back a primary database after a failover to a physical standby.
- B. When a flashback database operation is performed on a primary database, a physical standby database is also flashed back automatically.
- C. You can use it when real-time apply is enabled in case the phylt may not be used to flash back a primary database after a failover to a logical standby.
- D. It may be used to flash back a physical standby that receives redo from a far sync instance.
- E. When a flashback database operation is performed on a primary database, a logical standby database is also flashed back automatically.
- F. You can use it when real-time apply is enabled in case the physical standby suffers from logical corruption.

**Answer: A,D,F**

Explanation:
Flashback Database is a feature that allows reverting a database to a previous point in time, which is extremely useful in various Data Guard configurations:
It may be used to flash back a physical standby that receives redo from a far sync instance (C): Flashback Database can be used on a physical standby database to revert it to a past point in time, even when it is receiving redo data from a far sync instance. This can be particularly useful to recover from logical corruptions or unwanted changes.
You can use it when real-time apply is enabled in case the physical standby suffers from logical corruption (D): Even when real-time apply is enabled, which allows redo data to be applied to the standby database as soon as it is received, Flashback Database can be used to revert the physical standby database to a point in time before the logical corruption occurred.
It may not be used to flash back a primary database after a failover to a physical standby (E): After a failover has occurred from a primary to a physical standby database, making the standby the new primary, Flashback Database cannot be used to revert the old primary database to a state before the failover because the failover operation makes irreversible changes to the database role and configuration.

## NEW QUESTION # 100
Which TWO statements are true about database parameters for databases in a Data Guard environment?

- A. COMPATIBLE must have identical values for primary and standby databases.
- B. LOG_FILE_NAME_CONVERT applies to online redo logs and archived logs.
- C. DB_FILE_NAME_CONVERT is only required if the standby database is on the same host as the primary database.
- D. The databases that are part of a Data Guard configuration must have different DB_UNIQUE_NAME initialization parameters.
- E. If DB_RECOVERY_FILE_DEST is specified, then LOG_ARCHIVE_DEST_n is not required for local archive logs.

**Answer: A,D**
