Thema	Einzelheiten
Thema 1	<ul style="list-style-type: none">Falcon Cloud Security Features and Services: This domain covers understanding CrowdStrike's cloud security products (CSPM, CWP, ASPM, DSPM, IaC security) and their integration, plus one-click sensor deployment and Kubernetes admission controller capabilities.
Thema 2	<ul style="list-style-type: none">Remediating and Reporting Issues: This domain addresses identifying remediation steps for findings, using scheduled reports for cloud security, and utilizing Falcon Fusion SOAR workflows for automated notifications.
Thema 3	<ul style="list-style-type: none">Cloud Account Registration: This domain focuses on selecting secure registration methods for cloud environments, understanding required roles, organizing resources into cloud groups, configuring scan exclusions, and troubleshooting registration issues.

Thema 4	<ul style="list-style-type: none"> • Pre-Runtime Protection: This domain covers managing registry connections, selecting image assessment methods, and analyzing assessment reports to identify malware, CVEs, leaked secrets, Dockerfile misconfigurations, and vulnerabilities before deployment.
Thema 5	<ul style="list-style-type: none"> • Runtime Protection: This domain focuses on selecting appropriate Falcon sensors for Kubernetes environments, troubleshooting deployments, and identifying misconfigurations, unassessed images, IOAs, rogue containers, drift, and network connections.

CrowdStrike Certified Cloud Specialist CCCS-203b Prüfungsfragen mit Lösungen (Q356-Q361):

356. Frage

What is a key benefit of Falcon Cloud Security's integration of its components within a single platform?

- A. It eliminates the need for traditional SIEM tools by storing all security logs in the Falcon platform
- B. It allows for seamless encryption of all cloud data, ensuring compliance with GDPR and CCPA.
- C. It reduces the need for manual threat analysis by leveraging AI-powered threat detection and response.
- D. It provides a built-in firewall to secure cloud environments against external attacks.

Antwort: C

Begründung:

Option A: While encryption is a critical aspect of cloud security, Falcon Cloud Security does not perform data encryption. Instead, it provides unified visibility, detection, and protection across cloud workloads and environments.

Option B: Falcon Cloud Security integrates with SIEM tools to enhance security operations but does not replace them entirely. It collects telemetry and threat data, which can be shared with SIEM solutions for deeper analysis.

Option C: Falcon Cloud Security integrates AI and machine learning to automate threat detection and response, reducing the manual workload for security teams. This is a primary benefit of its unified platform approach.

Option D: Falcon Cloud Security is not a firewall. Instead, it focuses on endpoint protection, workload security, and threat detection, which complement network-based tools like firewalls.

357. Frage

Which action is required when creating a new image registry connection that accesses a privately hosted registry?

- A. Confirm expiration date of the secret for any used service accounts
- B. Verify the token and secret
- C. Add CrowdStrike IP addresses to registry allowlists
- D. Verify the registry URL

Antwort: B

Begründung:

When configuring a new image registry connection for a privately hosted container registry in CrowdStrike Falcon Cloud Security, the required and most critical action is to verify the token and secret used for authentication. Private registries require explicit credentials so Falcon can securely access and assess container images for vulnerabilities, malware, and misconfigurations.

CrowdStrike supports multiple private registry types (such as private Docker registries or cloud-native registries with restricted access). In all cases, Falcon relies on valid authentication credentials—typically a token, username/password, or service account secret—to pull image metadata and layers. If these credentials are incorrect, expired, or misconfigured, image assessment will fail even if the registry connection appears configured.

Other options may be relevant in specific environments but are not universally required at creation time.

Registry URLs are validated during setup, and allowlisting IP addresses may be necessary only if strict network controls are in place.

Secret expiration checks are a maintenance concern, not a mandatory creation step.

Therefore, the required action when creating a private registry connection is to verify the token and secret.

358. Frage

What is the potential impact if CrowdStrike IP addresses are not added to your container registry allowlist for image assessment?

- A. Image assessment will fail, but other CrowdStrike services will continue to function.
- B. Image assessment will proceed with reduced capabilities.
- C. CrowdStrike will switch to a default public IP to bypass the restriction.
- D. Image assessment will continue without any issues due to fallback IP detection.

Antwort: A

Begründung:

Option A: This is incorrect because CrowdStrike does not use fallback public IPs to bypass restrictions. The exact IP addresses provided in the CrowdStrike Console must be allowlisted.

Option B: This is correct because failing to allowlist CrowdStrike IP addresses specifically affects the image assessment functionality. Other CrowdStrike services that do not rely on the registry allowlist may continue to operate normally.

Option C: This is incorrect because CrowdStrike does not have a fallback mechanism for IP detection in this context. The specified IP addresses must be explicitly allowlisted to enable image assessment.

Option D: This is incorrect because image assessment requires direct communication with the container registry. Without allowlisted IP addresses, the assessment will fail entirely, not operate with reduced capabilities.

359. Frage

CrowdStrike Falcon Cloud Workload Protection (CWP) offers runtime protection for containerized workloads. Which feature or approach best helps identify unassessed images running in production?

- A. Integration with CI/CD for Build-Time Analysis
- B. Image Scanning in Development Pipelines
- C. Runtime Inventory of Running Containers
- D. Manual Configuration of Image Repositories

Antwort: C

Begründung:

Option A: This option refers to pre-deployment scanning of images in CI/CD pipelines. While important, it doesn't address images that bypass these pipelines and are directly deployed to production without being assessed.

Option B: CrowdStrike Falcon provides runtime inventory capabilities, allowing users to identify and monitor container images currently running in production environments. This feature is critical for detecting unassessed or unverified images because it directly analyzes the live runtime environment, bypassing any gaps left during development or build phases.

Option C: This focuses on build-time security and does not account for runtime environments.

Unassessed images might still appear in production if they are manually deployed or come from external sources.

Option D: Manually configuring image repositories might ensure compliance with certain policies, but it doesn't provide real-time visibility into running containers or unassessed images in production environments.

360. Frage

How can you delete a registry connection from the CrowdStrike Falcon console without affecting other registry connections?

- A. Remove all associated images from the registry before attempting to delete the connection.
- B. Navigate to the "Image Assessment" page, select the specific registry connection, and click "Delete."
- C. Disable the "Image Assessment" feature globally and then remove the registry details.
- D. Use the "Bulk Delete" option to remove all registry connections, including the one you want to delete.

Antwort: B

Begründung:

Option A: Deleting associated images from the registry is not a prerequisite for removing a registry connection in CrowdStrike. The connection can be removed independently.

Option B: The "Image Assessment" page allows users to manage individual registry connections.

Deleting a specific connection can be done here without affecting other connections.

Option C: Disabling "Image Assessment" globally is not required to delete a specific registry connection. This action would unnecessarily impact all registry integrations.

Option D: The "Bulk Delete" option removes all registry connections, which is not suitable if you only want to delete one specific connection.
