One of the top features of Amazon SOA-C02 exam dumps is the SOA-C02 exam passing a money-back guarantee. In other words, your investments with Amazon SOA-C02 exam questions are secured with the 100 AWS Certified SysOps Administrator - Associate (SOA-C02) SOA-C02 exam passing a money-back guarantee. Due to any reason, if you did not succeed in the final Amazon SOA-C02 exam despite using Amazon SOA-C02 PDF Questions and practice tests, we will return your whole payment without any deduction. While practicing on AWS Certified SysOps Administrator - Associate (SOA-C02) SOA-C02 practice test software you will experience the real-time AWS Certified SysOps Administrator - Associate (SOA-C02) SOA-C02 exam environment for preparation. This will help you to understand the pattern of final Amazon SOA-C02 exam questions and answers.

Amazon SOA-C02 Exam is a challenging certification exam that requires a solid understanding of AWS core services, security, networking, and automation. It is a valuable credential for IT professionals who want to demonstrate their expertise in AWS system administration and advance their careers in the field of cloud computing.

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q177-Q182):

NEW QUESTION # 177

With the threat of ransomware viruses encrypting and holding company data hostage, which action should be taken to protect an Amazon S3 bucket?

- A. Enable snapshots on the bucket.
- B. Enable server-side encryption on the bucket.
- C. Deny Post, Put, and Delete on the bucket.
- D. Enable Amazon S3 versioning on the bucket.

Answer: D

Explanation:

Step-by-Step Explanation:

* Understand the Problem:

* The threat of ransomware encrypting and holding company data hostage.

* Need to protect an Amazon S3 bucket.

* Analyze the Requirements:

* Ensure that data in the S3 bucket is protected against unauthorized encryption or deletion.

* Evaluate the Options:

* Option A: Deny Post, Put, and Delete on the bucket.

* Denying these actions would prevent any uploads or modifications to the bucket, making it unusable.

* Option B: Enable server-side encryption on the bucket.

* Server-side encryption protects data at rest but does not prevent the encryption of data by ransomware.

* Option C: Enable Amazon S3 versioning on the bucket.

* S3 versioning keeps multiple versions of an object in the bucket. If a file is overwritten or encrypted by ransomware, previous versions of the file can still be accessed.

* Option D: Enable snapshots on the bucket.

* Amazon S3 does not have a snapshot feature; this option is not applicable.

* Select the Best Solution:

* Option C: Enabling Amazon S3 versioning is the best solution as it allows access to previous versions of objects, providing protection against ransomware encryption by retaining prior, unencrypted versions.

References:

* Amazon S3 Versioning

* Best Practices for Protecting Data with Amazon S3

Enabling S3 versioning ensures that previous versions of objects are preserved, providing a safeguard against ransomware by allowing recovery of unencrypted versions of data.

NEW QUESTION # 178

A company has 50 AWS accounts and wants to create an identical Amazon VPC in each account. Any changes the company makes to the VPCs in the future must be implemented on every VPC.

What is the MOST operationally efficient method to deploy and update the VPCs in each account?

- A. Create an AWS CloudFormation template that defines the VPC. Sign in to the AWS Management Console under each account. Create a stack from the template.
- B. Create a shell script that configures the VPC using the AWS CLI. Provide a list of accounts to the shell script from a text

file. Create the VPC in every account in the list.

- C. Create an AWS Lambda function that configures the VPStore the account information in Amazon DynamoDB. Grant Lambda access to the DynamoDB table. Create the VPC in every account in the list.
- **D. Create an AWS CloudFormation template that defines the VPC. Create an AWS CloudFormation StackSet based on the template. Deploy the template to all accounts using the stack set.**

Answer: D

NEW QUESTION # 179

A company plans to launch a static website on its domain example.com and subdomain www.example.com using Amazon S3. How should the SysOps administrator meet this requirement?

- A. Create one S3 bucket named example.com for both the domain and subdomain.
- B. Create one S3 bucket with a wildcard named *.example.com for both the domain and subdomain.
- C. Create two S3 buckets named http://www.example.com and http://example.com. Configure the wildcard (*) bucket to redirect requests to the domain bucket.
- **D. Create two S3 buckets named example.com and www.example.com. Configure the subdomain bucket to redirect requests to the domain bucket.**

Answer: D

Explanation:

<https://docs.aws.amazon.com/AmazonS3/latest/userguide/website-hosting-custom-domain-walkthrough.html>

NEW QUESTION # 180

A company runs a stateless application that is hosted on an Amazon EC2 instance. Users are reporting performance issues. A SysOps administrator reviews the Amazon CloudWatch metrics for the application and notices that the instance's CPU utilization frequently reaches 90% during business hours.

What is the MOST operationally efficient solution that will improve the application's responsiveness?

- A. Create a CloudWatch alarm that activates when the EC2 instance's CPU utilization goes above 80%.
Configure the alarm to invoke an AWS Lambda function that vertically scales the instance.
- B. Configure an AWS Client VPN connection to allow the application users to connect directly to the EC2 instance private IP address to reduce latency.
- C. Configure CloudWatch logging on the EC2 instance.
Configure a CloudWatch alarm for CPU utilization to alert the SysOps administrator when CPU utilization goes above 90%.
- **D. Create an Auto Scaling group, and assign it to an Application Load Balancer.
Configure a target tracking scaling policy that is based on the average CPU utilization of the Auto Scaling group.**

Answer: D

Explanation:

<https://docs.aws.amazon.com/autoscaling/ec2/userguide/as-scaling-target-tracking.html>

NEW QUESTION # 181

A SysOps administrator is unable to launch Amazon EC2 instances into a VPC because there are no available private IPv4 addresses in the VPC. Which combination of actions must the SysOps administrator take to launch the instances? (Select TWO.)

- **A. Create a new subnet for the VPC**
- **B. Associate a secondary IPv4 CIDR block with the VPC**
- C. Associate a primary IPv6 CIDR block with the VPC
- D. Modify the CIDR block of the subnet that is associated with the instances
- E. Modify the CIDR block of the VPC

Answer: A,B

Explanation:
