## CompTIA Server+ Certification Exam Sample Questions (Q274-Q279):

### NEW QUESTION # 274

A server administrator is using remote access to update a server. The administrator notices numerous error messages when using YUM to update the applications on a server. Which of the following should the administrator check FIRST?

- A. LVM status on the server
- B. YUM dependencies
- C. Disk space in the /var directory
- D. Network connectivity on the server

### Answer: C

Explanation:

The administrator should check disk space in the /var directory first when using YUM to update applications on a server. YUM stands for Yellowdog Updater Modified, which is a software package manager for Linux systems that use RPM (Red Hat Package Manager) packages. YUM downloads and installs packages from online repositories and resolves dependencies automatically. YUM stores its cache files in the /var/cache/yum directory by default. These cache files include metadata and package data for each repository that YUM uses. If there is not enough disk space in the /var directory, YUM may fail to update applications and generate error messages.

### NEW QUESTION # 275

Which of the following is the BEST action to perform before applying patches to one of the hosts in a high availability cluster?

- A. Disable the heartbeat network.
- B. **Failover all VMs.**
- C. Set the cluster to active-active.
- D. Fallback cluster services.

### Answer: B

Explanation:

Explanation

This is the best action to perform before applying patches to one of the hosts in a high availability cluster. A high availability cluster is a group of hosts that act like a single system and provide continuous uptime. A high availability cluster is often used for load balancing, backup, and failover purposes. Failover is a process of transferring workloads from one host to another in case of a failure or maintenance. By failing over all VMs (Virtual Machines) from the host that needs to be patched to another host in the cluster, the technician can ensure that there is no downtime or data loss during the patching process. Disabling the heartbeat network is not a good action to perform, as this would disrupt the communication and synchronization between the hosts in the cluster. Fallback cluster services is not a valid term, but it may refer to restoring cluster services after a failover, which is not relevant before applying patches. Setting the cluster to active-active is not a good action to perform, as this would increase the load on both hosts and reduce redundancy. References:

### NEW QUESTION # 276

Which of the following is typical of software licensing in the cloud?

- A. Per socket
- B. **Subscription-based**
- C. Perpetual
- D. Site-based

### Answer: B

Explanation:

Explanation

Cloud software licensing refers to the process of managing and storing software licenses in the cloud. The benefits of cloud software licensing models are vast. The main and most attractive benefit has to do with the ease of use for software vendors and the ability to provide customizable cloud software license management based on customer needs and desires<sup>1</sup>. Cloud-based licensing gives software developers and vendors the opportunity to deliver software easily and quickly and gives customers full control over their licenses, their analytics, and more<sup>1</sup>. Cloud based licensing gives software sellers the ability to add subscription models to their roster of services<sup>1</sup>. Subscription models are one of the most popular forms of licensing today<sup>1</sup>. Users sign up for a subscription (often based on various options and levels of use, features, etc.) and receive their licenses instantly<sup>1</sup>. ### NEW QUESTION # 277

A technician is attempting to log in to a Linux server as root but cannot remember the administrator password.

Which of the following is the LEAST destructive method of resetting the administrator password?

- A. Boot using a Linux live CD and mount the hard disk to /mnt. SCP the /etc directory from a known accessible server to /mnt/etc.
- B. Boot using a Linux live CD and mount the hard disk to /mnt. Change to the /mnt/etc directory. Edit the passwd file found in that directory.
- C. **Adjust the GRUB boot parameters to boot into single-user mode. Run passwd from the command prompt.**
- D. Reinstall the OS in overlay mode. Reset the root password from the install GUI screen.

**Answer: C**

Explanation:

Explanation

This is the least destructive method of resetting the administrator password because it does not require modifying any files or reinstalling the OS. It only requires changing the boot parameters temporarily and running a command to change the password.

**NEW QUESTION # 278**

A technician is laying out a filesystem on a new Linux server. Which of the following tools would work BEST to allow the technician to increase a partition's size in the future without reformatting it?

- A. Format
- **B. LVM**
- C. fdisk
- D. DiskPart

**Answer: B**

Explanation:

LVM (Logical Volume Manager) is a tool that allows the technician to increase a partition's size in the future without reformatting it on a Linux server. LVM creates logical volumes that can span across multiple physical disks or partitions and can be resized dynamically without losing data. LVM also provides other features such as snapshots, encryption, and RAID. DiskPart, fdisk, and Format are tools that can be used to partition and format disks, but they do not allow increasing a partition's size without reformatting it.
