Looking for top-notch Implementing and Operating SnowPro Advanced Architect Certification (ARA-C01) exam questions? You've come to the right place! NewPassLeader offers a comprehensive and affordable solution for all your ARA-C01 exam needs. Our ARA-C01 Exam Questions are regularly updated, and we provide a range of attractive features to enhance your preparation, including PDF format, an online practice test engine.

Now you can think of obtaining any Snowflake certification to enhance your professional career. NewPassLeader's study guides are your best ally to get a definite success in ARA-C01 exam. The guides contain excellent information, exam-oriented questions and answers format on all topics of the certification syllabus. With 100% Guaranteed of Success: NewPassLeader's promise is to get you a wonderful success in ARA-C01 Certification exams. Select any certification exam, ARA-C01 dumps will help you ace it in first attempt. No more cramming from books and note, just prepare our interactive questions and answers and learn everything necessary to easily pass the actual ARA-C01 exam.

Marvelous Latest ARA-C01 Exam Pdf & Guaranteed Snowflake ARA-C01 Exam Success with High Pass-Rate ARA-C01 New Dumps Questions

You will feel comfortable and pleasant to shop on such a good website. All the contents of our ARA-C01 training dumps are organized logically. Each small part contains a specific module. You can clearly get all the information about our ARA-C01 study guide. If you cannot find what you want to know, you can have a conversation with our online workers. Your questions on ARA-C01 Exam Dumps will be answered accurately and quickly. We are still working hard to satisfy your demands.

The SnowPro Advanced Architect Certification exam is an online, proctored exam that consists of 60 multiple-choice questions. ARA-C01 Exam content is designed to test the candidate's knowledge of the Snowflake platform and its various features. ARA-C01 exam is timed, and candidates have two hours to complete it. SnowPro Advanced Architect Certification certification is a globally recognized certification, and it allows professionals to showcase their expertise in Snowflake's cloud data platform.

Snowflake SnowPro Advanced Architect Certification Sample Questions (Q36-Q41):

NEW QUESTION # 36

A Snowflake Architect is designing an application and tenancy strategy for an organization where strong legal isolation rules as well as multi-tenancy are requirements.

Which approach will meet these requirements if Role-Based Access Policies (RBAC) is a viable option for isolating tenants?

- A. Create a multi-tenant table strategy if row level security is not viable for isolating tenants.
- B. Create an object for each tenant strategy if row level security is not viable for isolating tenants.
- **C. Create accounts for each tenant in the Snowflake organization.**
- D. Create an object for each tenant strategy if row level security is viable for isolating tenants.

Answer: C

Explanation:

This approach meets the requirements of strong legal isolation and multi-tenancy. By creating separate accounts for each tenant, the application can ensure that each tenant has its own dedicated storage, compute, and metadata resources, as well as its own encryption keys and security policies. This provides the highest level of isolation and data protection among the tenancy models. Furthermore, by creating the accounts within the same Snowflake organization, the application can leverage the features of Snowflake Organizations, such as centralized billing, account management, and cross-account data sharing.

NEW QUESTION # 37

An Architect is implementing a CI/CD process. When attempting to clone a table from a production to a development environment, the cloning operation fails.

What could be causing this to happen?

- **A. The table has a masking policy.**
- B. The retention time for the table is set to zero.
- C. Tables cannot be cloned from a higher environment to a lower environment.
- D. The table is transient.

Answer: A

Explanation:

Cloning a table with a masking policy can cause the cloning operation to fail because the masking policy is not automatically cloned with the table. This is due to the fact that the masking policy is considered a separate object with its own set of privileges.

Reference

Snowflake Documentation on Cloning Considerations.

NEW QUESTION # 38

A company has a Snowflake account named ACCOUNTA in AWS us-east-1 region. The company stores its marketing data in a Snowflake database named MARKET_DB. One of the company's business partners has an account named PARTNERB in Azure East US 2 region. For marketing purposes the company has agreed to share the database MARKET_DB with the partner account. Which of the following steps MUST be performed for the account PARTNERB to consume data from the MARKET_DB database?

- A. Create a share of database MARKET_DB, and create a new database out of this share locally in AWS us-east-1 region. Then replicate this database to the partner's account PARTNERB.
- B. From account ACCOUNTA create a share of database MARKET_DB, and create a new database out of this share

locally in AWS us-east-1 region. Then make this database the provider and share it with the PARTNERB account.

- C. Create a new account (called AZABC123) in Azure East US 2 region. From account ACCOUNTA create a share of database MARKET_DB, create a new database out of this share locally in AWS us-east-1 region, and replicate this new database to AZABC123 account. Then set up data sharing to the PARTNERB account.
- D. Create a new account (called AZABC123) in Azure East US 2 region. From account ACCOUNTA replicate the database MARKET_DB to AZABC123 and from this account set up the data sharing to the PARTNERB account.

Answer: D

Explanation:

Explanation

* Snowflake supports data sharing across regions and cloud platforms using account replication and share replication features.

Account replication enables the replication of objects from a source account to one or more target accounts in the same organization. Share replication enables the replication of shares from a source account to one or more target accounts in the same organization¹.

* To share data from the MARKET_DB database in the ACCOUNTA account in AWS us-east-1 region with the PARTNERB account in Azure East US 2 region, the following steps must be performed:

* Create a new account (called AZABC123) in Azure East US 2 region. This account will act as a bridge between the source and the target accounts. The new account must be linked to the ACCOUNTA account using an organization².

* From the ACCOUNTA account, replicate the MARKET_DB database to the AZABC123 account using the account replication feature. This will create a secondary database in the AZABC123 account that is a replica of the primary database in the ACCOUNTA account³.

* From the AZABC123 account, set up the data sharing to the PARTNERB account using the share replication feature. This will create a share of the secondary database in the AZABC123 account and grant access to the PARTNERB account. The PARTNERB account can then create a database from the share and query the data⁴.

* Therefore, option C is the correct answer.

NEW QUESTION # 39

What transformations are supported in the below SQL statement? (Select THREE).

```
CREATE PIPE ... AS COPY ... FROM (...)
```

- A. Columns can be omitted.
- B. Type casts are supported.
- C. Data can be filtered by an optional where clause.
- D. Incoming data can be joined with other tables.
- E. The ON ERROR - ABORT statement command can be used.
- F. Columns can be reordered.

Answer: A,C,F

NEW QUESTION # 40

What is a characteristic of Role-Based Access Control (RBAC) as used in Snowflake?

- A. A user can use a "super-user" access along with securityadmin to bypass authorization checks and access all databases, schemas, and underlying objects.
- B. A user can create managed access schemas to support current and future grants and ensure only object owners can grant privileges to other roles.
- C. A user can create managed access schemas to support future grants and ensure only schema owners can grant privileges to other roles.
- D. Privileges can be granted at the database level and can be inherited by all underlying objects.

Answer: C

Explanation:

Role-Based Access Control (RBAC) is the Snowflake Access Control Framework that allows privileges to be granted by object owners to roles, and roles, in turn, can be assigned to users to restrict or allow actions to be performed on objects. A characteristic of RBAC as used in Snowflake is:

* Privileges can be granted at the database level and can be inherited by all underlying objects. This means that a role that has a certain privilege on a database, such as CREATE SCHEMA or USAGE, can also perform the same action on any schema, table, view, or other object within that database, unless explicitly revoked. This simplifies the access control management and reduces the number of grants required.

* A user can create managed access schemas to support future grants and ensure only schema owners can grant privileges to other roles. This means that a user can create a schema with the MANAGED ACCESS option, which changes the default behavior of object ownership and privilege granting within the schema. In a managed access schema, object owners lose the ability to grant privileges on their objects to other roles, and only the schema owner or a role with the MANAGE GRANTS privilege can do so. This enhances the security and governance of the schema and its objects.

The other options are not characteristics of RBAC as used in Snowflake:

* A user can use a "super-user" access along with securityadmin to bypass authorization checks and access all databases, schemas, and underlying objects. This is not true, as there is no such thing as a "super-user" access in Snowflake. The securityadmin role is a predefined role that can manage users and roles, but it does not have any privileges on any database objects by default. To access any object, the securityadmin role must be explicitly granted the appropriate privilege by the object owner or another role with the grant option.

* A user can create managed access schemas to support current and future grants and ensure only object owners can grant privileges to other roles. This is not true, as this contradicts the definition of a managed access schema. In a managed access schema, object owners cannot grant privileges on their objects to other roles, and only the schema owner or a role with the MANAGE GRANTS privilege can do so.

NEW QUESTION # 41

.....

The development of science and technology makes our life more comfortable and convenient, which also brings us more challenges. Many company requests candidates not only have work experiences, but also some professional certifications. Therefore it is necessary to get a professional Snowflake certification to pave the way for a better future. The ARA-C01 question and answers produced by our company, is helpful for our customers to pass their ARA-C01 exams and get the ARA-C01 certification within several days. Our ARA-C01 exam questions are your best choice.
