EMT Learning Materials & EMT Study guide & EMT Reliable Dumps

As we all know, the examination fees about EMT exam test is too expensive, so many IT candidates want to get the most valid and useful EMT study material and expect to pass the actual test at first attempt. FreeCram provide you with the latest EMT exam prep study material which can ensure you 100% pass. The quality & service of EMT exam dumps will give you a good shopping experience. The quality and quantities are controlled by strict standards. FreeCram has IT experts handling the latest IT information so as to adjust the outline for the exam dumps at the first time, thus to ensure the NREMT EMT training exam cram shown front of you is the latest and most relevant.

NREMT Emergency Medical Technicians Exam Sample Questions (Q33-Q38):

NEW QUESTION # 33

A 9-year-old patient who was injured in an MCI is brought to the treatment area with a delayed triage tag. Which of the following

signs or symptoms would the EMT expect to find? Select the three correct options.

- A. Respiratory rate of 16
- B. Mottled skin
- C. Palpable pulses being present
- D. Follows simple commands
- E. Ability to ambulate
- F. Breathing only after opening the airway

Answer: C,D,E

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In pediatric START or JumpSTART triage, a "delayed" status is appropriate if the child is breathing adequately, has palpable pulses, and follows commands. The respiratory rate of 16 is normal for a 9-year-old, and being able to walk also supports the "delayed" tag.

"Mottled skin" and "breathing only after airway opening" would more likely lead to "immediate" or even "expectant" categories depending on associated symptoms.

NEW QUESTION # 34

A 32-year-old female has a history of dysmenorrhea, abdominopelvic pain, and pain when having a bowel movement. She has not been sexually active in 8 months. Her symptoms are most likely caused by

- A. Premature menopause
- B. Endometrial tissue growing outside the uterus
- C. An infection that is either bacteria or a virus
- D. Spontaneous abortion

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

These symptoms are classic for endometriosis, where endometrial tissue grows outside the uterus.

Symptoms often include:

- * Pelvic pain
- * Painful menstruation (dysmenorrhea)
- * Painful bowel movements or intercourse

Spontaneous abortion does not apply here due to lack of pregnancy. Premature menopause is rare at this age and presents differently. Infection is less likely in the absence of recent sexual activity or fever.

NEW QUESTION # 35

What characteristics of the pediatric airway are different from the adult airway?

- A. Proportionately larger tongue and proportionately larger occiput
- B. Proportionately smaller tongue and proportionately smaller occiput
- C. Proportionately smaller tongue and proportionately larger occiput
- D. Proportionately larger tongue and proportionately smaller occiput

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Compared to adults, pediatric patients have:

- * A proportionately larger tongue, which increases the risk of airway obstruction
- * A larger occiput, which causes natural neck flexion when lying supine, potentially occluding the airway. This anatomical difference is why EMS providers often use a shoulder roll instead of a head tilt to maintain a neutral airway in infants and toddlers.

NEW QUESTION # 36

A 19-year-old patient has received multiple stab wounds. The patient is unresponsive. The vital signs are BP 82/60, P 116, R 28, and SpO₂ 86%. Which substance would the EMT expect to increase in the patient's body?

- A. Lactic acid
- B. Sodium bicarbonate
- C. Water
- D. Carbon dioxide

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The patient is in hypoperfusion (shock) from blood loss. In shock states, tissues are deprived of oxygen, leading to anaerobic metabolism, which produces lactic acid as a byproduct. This causes metabolic acidosis, which is a critical sign of systemic oxygen debt.

Carbon dioxide rises with respiratory failure, but lactic acid is a more specific indicator of cellular hypoxia.

NEW QUESTION # 37

An 83-year-old patient is unresponsive and lying on the floor. The patient has a large bruise and laceration on the forehead. The patient's vital signs are BP 90/60, P 126, and R 0. Which of the following conditions should the EMT most suspect?

- A. Brain herniation
- B. Open pneumothorax
- C. Spine injury
- D. Commotio cordis

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Given fall with head trauma and absent respirations, the most concerning cause is spinal injury, particularly a cervical spine fracture. A high cervical injury (C1-C4) can paralyze the diaphragm, leading to apnea despite a beating heart.

Brain herniation can also depress respirations but often presents with unequal pupils, posturing, and Cushing's triad (not described here). Commotio cordis is sudden cardiac arrest from blunt chest trauma (not head).

Open pneumothorax affects chest mechanics, not directly linked here.
