## Fantastic Valid AP-202 Exam Topics | Easy To Study and Pass Exam at first attempt & The Best Salesforce B2B Commerce for Developers Accredited Professional

In order to help customers solve problems, our company always insist on putting them first and providing valued service. We deeply believe that our AP-202 question torrent will help you pass the exam and get your certification successfully in a short time. Maybe you cannot wait to understand our AP-202 Guide questions; we can promise that our products have a higher quality when compared with other study materials. At the moment I am willing to show our AP-202 guide torrents to you, and I can make a bet that you will be fond of our products if you understand it.

## Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q80-Q85):

### NEW QUESTION # 80

A developer needs to implement a custom Lightning web component (LWC) for the storefront. The LWC contains language-specific text values. How should the developer translate the text values?

- A. Import static resources for the text values and add them into the LWC.
- B. Create a custom Metadata object for the text values and query it in the LWC.
- **C. Create custom labels for the text values and import them in the LW**
- D. Use a CustomLabel.xml file in the LWC to add the text values there.

**Answer: C**

Explanation:

Custom labels are text values that can be translated into any language that Salesforce supports. They are useful for displaying

language-specific text in Lightning web components. To use custom labels in a LWC, the developer needs to create them in the Setup menu and assign them to a language and a value. Then, the developer can import them in the LWC using the `@salesforce/labelScoped` module. For example, if the developer has a custom label named `welcomeHeader`, they can import it as follows:

```
import welcomeHeader from '@salesforce/label/c.welcomeHeader';
```

Then, they can use it in the HTML template or the JavaScript file of the LWC. For example, in the HTML template, they can use it as follows:

HTMLAI-generated code. Review and use carefully. More info on FAQ.

```
<template>
```

```
<h1>{welcomeHeader}</h1>
```

```
</template>
```

The custom label will automatically display the translated value based on the user's language preference. The developer can also use the `lightning-formatted-text` component to format the custom label value with HTML tags.

The other options are not correct because:

A) Importing static resources for the text values is not a recommended way to translate text values in a LWC. Static resources are files that are stored in Salesforce and can be referenced by applications. They are not designed for storing language-specific text values and they do not support automatic translation based on the user's language preference.

B) Using a CustomLabel xml file in the LWC to add the text values there is not a valid option. Custom labels are not stored in xml files, but in the Setup menu. They cannot be added directly to the LWC, but they need to be imported using the `@salesforce/labelScoped` module.

D) Creating a custom Metadata object for the text values and querying it in the LWC is not a feasible option. Custom Metadata objects are records that store configuration data that can be deployed and packaged. They are not intended for storing language-specific text values and they do not support automatic translation based on the user's language preference. Querying them in the LWC would also require an Apex class and a wire service, which would add unnecessary complexity to the solution.

Use Custom Labels in Lightning Web Components

Custom Labels

Internationalizing Your Lightning Web Component (LWC)

## NEW QUESTION # 81

Which two statements are true for Mass Order (2 answers)

- A. Mass Order pricing is done via a batch job.
- B. Mass Order is mobile ready with the ccrz templates.
- C. Mass order works with the default wishlists
- D. The variation product is leveraged for SKUs.

**Answer: A,D**

Explanation:

Mass Order pricing is done via a batch job, which means that the prices are not calculated in real time, but rather at a scheduled time. Mass order works with the variation product, which is a product that has multiple SKUs with different attributes, such as size or color. Mass order does not work with the default wishlists, which are used to store products that the customer wants to buy later. Mass order is not mobile ready with the ccrz templates, which are the default templates for the storefront pages. Salesforce B2B Commerce Developer Guide: Mass Order, B2B Commerce Developer Guide: Variation Products

## NEW QUESTION # 82

Which orders can a user view on Order List Component (Aura) for B2B stores?

- A. Orders placed in any storefront and related to the current effective account
- B. Orders placed in any storefront and related to the current user's account
- C. Orders placed in the current storefront and related to the current user's account
- D. Orders placed in the current storefront and related to the current effective account

**Answer: D**

Explanation:

According to the B2B Commerce Developer Guide, the Order List Component (Aura) for B2B stores displays a list of orders that the user can view and reorder. The component filters the orders based on the current storefront and the current effective account. The current effective account is the account that the user is currently acting on behalf of, which can be different from the user's own

account. The component does not show orders placed in other storefronts or related to other accounts, even if the user has access to them. Therefore, the correct answer is A. Orders placed in the current storefront and related to the current effective account. The other options are incorrect because they do not match the criteria of the component. B2B Commerce Developer Guide, Show the Order List Widget

#### NEW QUESTION # 83

Which Global JavaScript Object should be extended when writing custom Remote Actions?

- A. CCRZ.cc\_CallContext
- B. CCRZ.
- C. CCRZ.RemoteInvocation
- **D. CCRZ.cc**

**Answer: D**

Explanation:

The Global JavaScript Object that should be extended when writing custom Remote Actions is CCRZ.cc. This object contains all the Remote Actions that are defined in the cloudcraze managed package, which can be overridden or extended by subscriber code. The object also provides a mechanism for registering custom Remote Actions that can be invoked by the user interface components. For example, CCRZ.cc.customAction = function(params, callback){ // do something } will define a custom Remote Action named customAction that can be called by CCRZ.cc.customAction(params, callback). Salesforce B2B Commerce and D2C Commerce Developer Guide, Remote Actions

#### NEW QUESTION # 84

Which three actions are applicable when extending a default Salesforce B2B Commerce page via a page include? (3 answers)

- A. Prepend "c." to the name of the page referenced in the configuration setting.
- B. Create a Service Class override to query the new page include.
- **C. Build and activate a new configuration cache setting via CC admin.**
- **D. Create the VisualForce page you wish to include to the Salesforce B2B Commerce page.**
- **E. Create a configuration setting for enabling the page include and assigning the new page include via CC admin.**

**Answer: C,D,E**

Explanation:

Three actions that are applicable when extending a default Salesforce B2B Commerce page via a page include are:  
Create the VisualForce page you wish to include to the Salesforce B2B Commerce page. This page will contain the custom content or logic that you want to add to the existing page. For example, you can create a VisualForce page named MyPageInclude that displays some additional information or functionality on the product detail page.

Create a configuration setting for enabling the page include and assigning the new page include via CC Admin. This setting will specify which page include you want to use for which page and section. For example, you can create a configuration setting named CO.MyPageInclude with the value PDV.BodyIncludeBegin.MyPageInclude, which means you want to use MyPageInclude as the body include begin for the product detail view (PDV) page.

Build and activate a new configuration cache setting via CC Admin. This action will refresh the cache and apply the changes to the storefront. You need to do this whenever you make any changes to the configuration settings or VisualForce pages. Salesforce B2B Commerce and D2C Commerce Developer Guide, Page Includes

#### NEW QUESTION # 85

.....

As we all know, it is a must for all of the candidates to pass the exam if they want to get the related AP-202 certification which serves as the best evidence for them to show their knowledge and skills. If you want to simplify the preparation process, here comes a piece of good news for you. Our AP-202 Exam Question has been widely praised by all of our customers in many countries and our company has become the leader in this field. Now I would like to give you some detailed information about the advantages of our AP-202 guide torrent.
