

# HPE7-A01 - Efficient Online Aruba Certified Campus Access Professional Exam Training

P.S. Free & New HPE7-A01 dumps are available on Google Drive shared by BraindumpsPass: [https://drive.google.com/open?id=1gHi6SL33a\\_fiNHnlwZrNmrbeh643nLPU](https://drive.google.com/open?id=1gHi6SL33a_fiNHnlwZrNmrbeh643nLPU)

Our HPE7-A01 training materials provide 3 versions to the client and they include the PDF version, PC version, APP online version. Each version's using method and functions are different but the questions and answers of our HPE7-A01 study quiz is the same. The client can decide which HPE7-A01 version to choose according to their hobbies and their practical conditions. You will be surprised by the convenient functions of our HPE7-A01 exam dumps.

The ACCP certification validates the knowledge and skills required to design, implement, and manage Aruba wireless networks in enterprise environments. It demonstrates that the certified professional has a deep understanding of Aruba wireless products and technologies, as well as the ability to troubleshoot and optimize Aruba wireless networks.

## Reverse the Exam Anxiety By Getting the Real HP HPE7-A01 Dumps

The Aruba Certified Campus Access Professional Exam (HPE7-A01) exam questions are real, valid, and verified by HP HPE7-A01 certification exam trainers. They work together and put all their efforts to ensure the top standard and relevancy of HPE7-A01 Exam Dumps all the time. So we can say that with HP HPE7-A01 exam questions you will get everything that you need to make the HPE7-A01 exam preparation simple, smart, and successful.

HPE7-A01 exam is focused on testing the candidate's understanding of the Aruba Campus Switching solutions, including the ArubaOS-CX operating system and the Aruba hardware platforms. It also covers topics such as VLANs, Spanning Tree, link aggregation, and Layer 3 routing. Candidates who Pass HPE7-A01 Exam will be able to design, implement, and troubleshoot complex network solutions using Aruba's technology.

## HP Aruba Certified Campus Access Professional Exam Sample Questions (Q46-Q51):

### NEW QUESTION # 46

A company is in the planning stages to migrate to all their wireless domain laptops from WPA2 from WPA2 EAP-PEAP to EAP-TLS with machine Authentication. The administrator is testing a new Group Policy (GPO) that was pushed to only a few windows domain Laptops. The policy will configure the wireless profile to perform machine and certificate-based authentication. To support this new initiative the administrator also configured a new HPE Aruba Networking ClearPass 802.1X wireless service that only allows devices that successfully perform machine and certificate-based authentication. After successfully pushing the GPO,

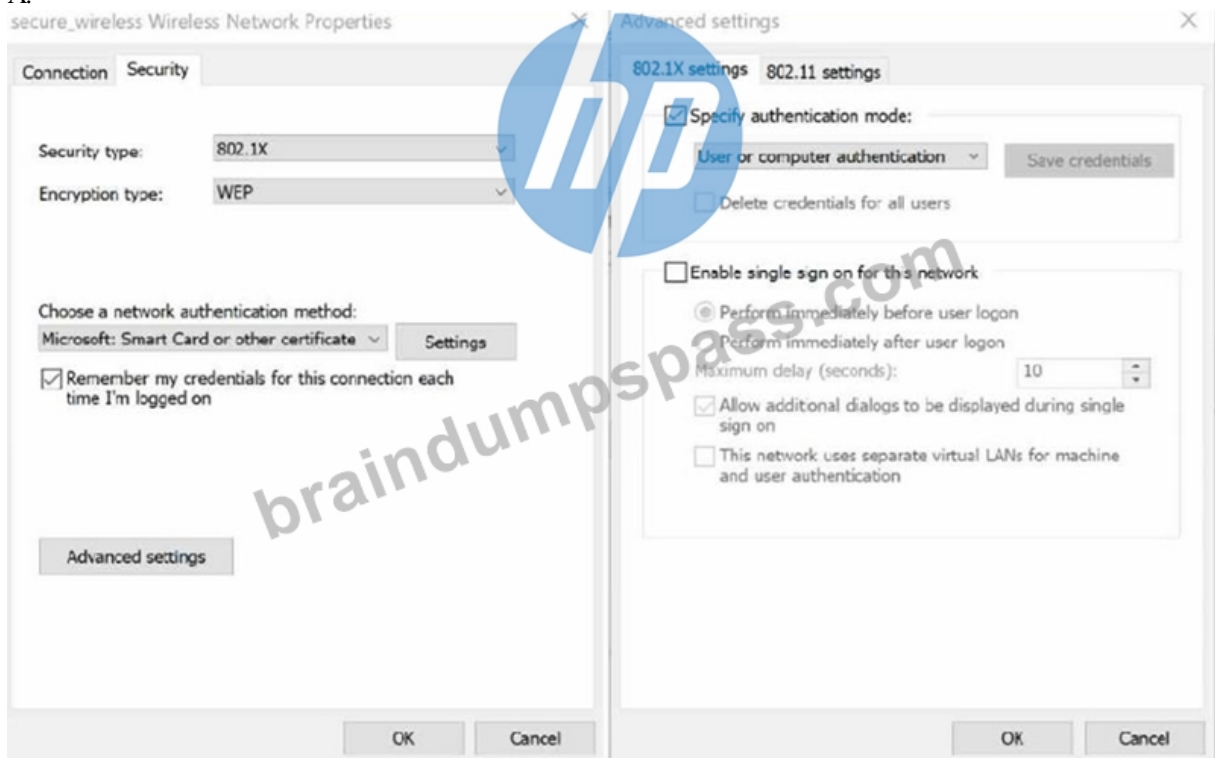

the Windows laptops are unable to join the configured "secure\_wireless" SSID as shown below.

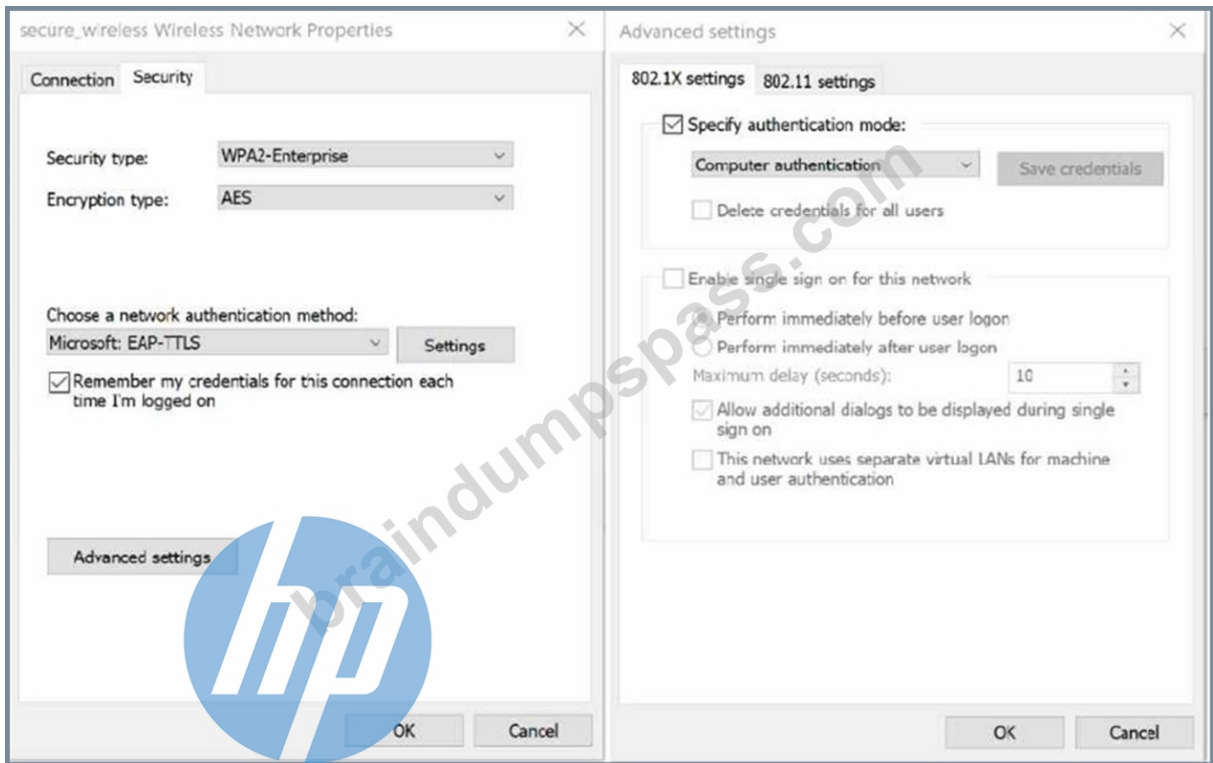

Name (Profile)	Security	Access Type	Traffic forwarding mode	Network Enabled
secure_wireless	wpa2.aes	Role Based	Bridge	Yes
open_wireless	opensystem	Unrestricted	Bridge	Yes

Which configuration setting would resolve this issue?

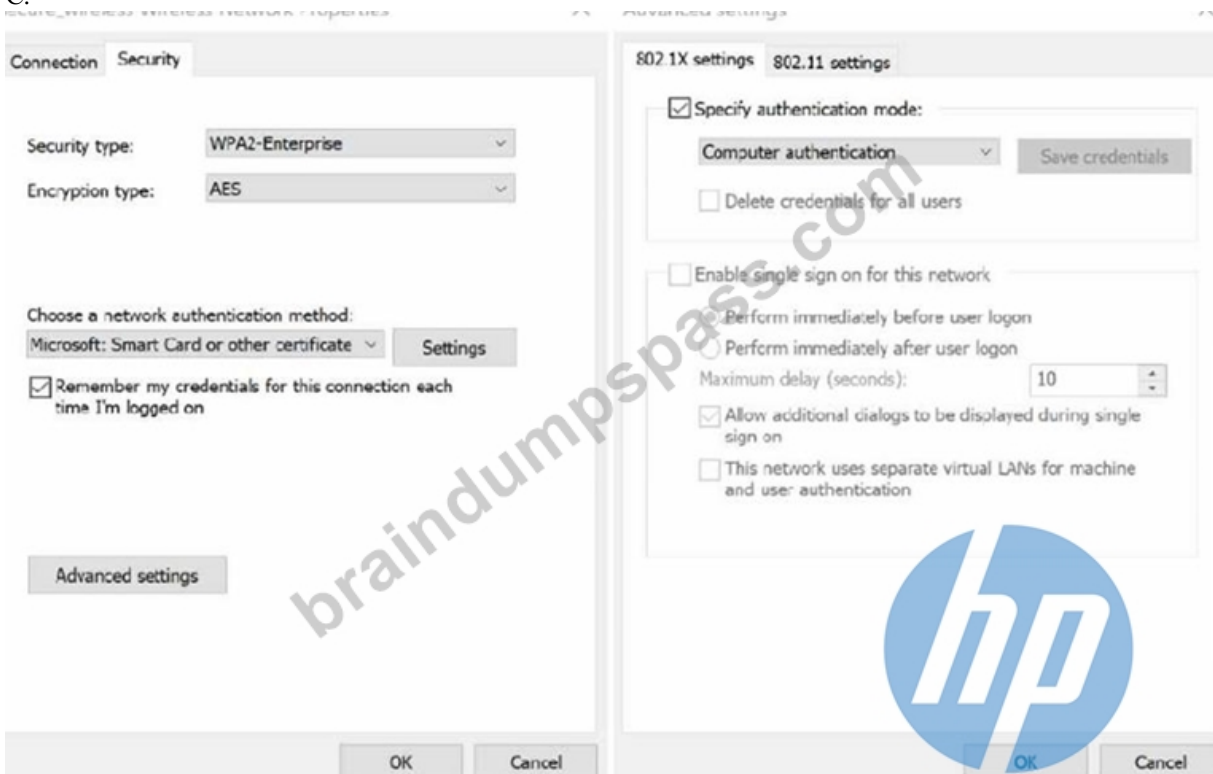

- A.

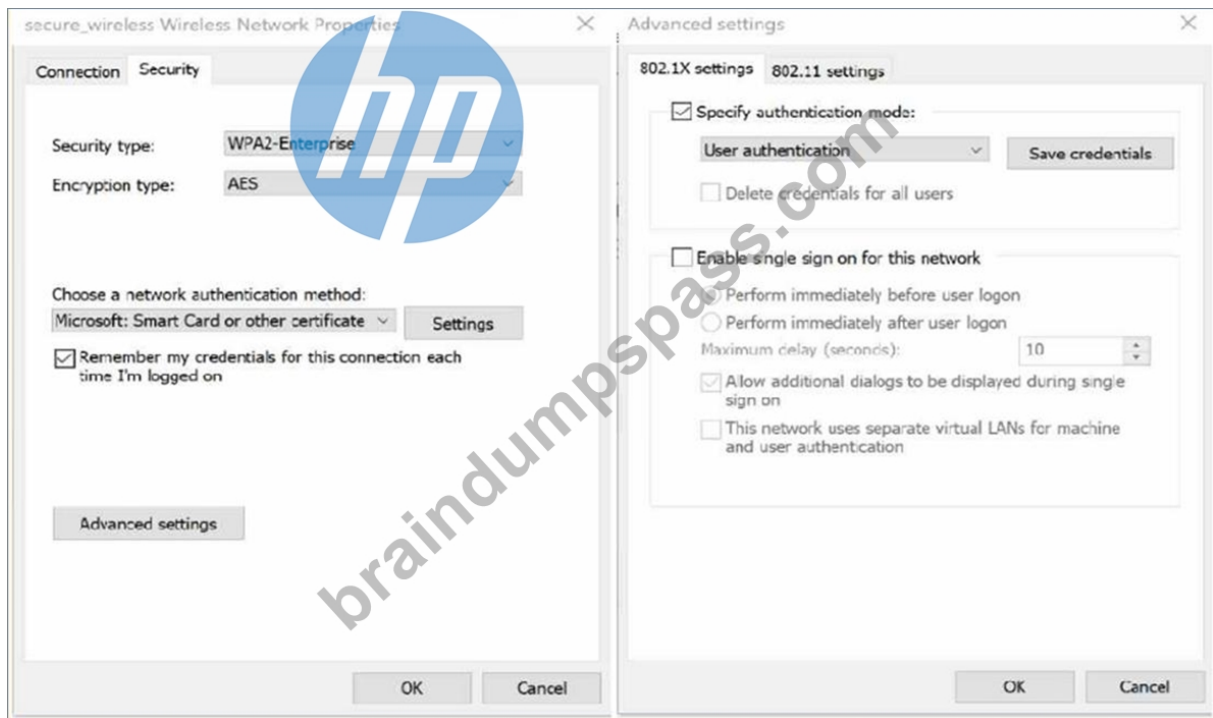

- B.

- C.

- D.

**Answer: B**

Explanation:

This The chosen configuration matches the ClearPass policy requiring certificate-based machine authentication and will allow the laptop to join the "secure\_wireless" SSID.

#### NEW QUESTION # 47

Describe the difference between Class of Service (CoS) and Differentiated Services Code Point (DSCP).

- A. They are similar and can be used interchangeably.
- B. CoS has much finer granularity than DSCP
- C. CoS is only used to determine CLASS of traffic DSCP is only used to differentiate between different Classes.
- D. CoS is only contained in VLAN Tag fields DSCP is in the IP Header and preserved throughout the IP packet flow

**Answer: D**

Explanation:

CoS and DSCP are both methods of marking packets for quality of service (QoS) purposes. QoS is a mechanism that allows network devices to prioritize and differentiate traffic based on certain criteria, such as application type, source, destination, etc. CoS stands for Class of Service and is a 3-bit field in the 802.1Q VLAN tag header. CoS can only be used on Ethernet frames that have a VLAN tag, and it can only be preserved within a single VLAN domain. DSCP stands for Differentiated Services Code Point and is a 6-bit field in the IP header. DSCP can be used on any IP packet, regardless of the underlying layer 2 technology, and it can be preserved throughout the IP packet flow, unless it is modified by intermediate devices.

#### NEW QUESTION # 48

Which feature supported by SNMPv3 provides an advantage over SNMPv2c?

- A. Transport mapping
- B. Encryption
- C. Community strings
- D. GetBulk

**Answer: B**

Explanation:

Encryption is a feature supported by SNMPv3 that provides an advantage over SNMPv2c. Encryption protects the confidentiality

and integrity of SNMP messages by encrypting them with a secret key.

SNMPv2c does not support encryption and relies on community strings for authentication and authorization, which are transmitted in clear text and can be easily intercepted or spoofed. Transport mapping, community strings, and GetBulk are features that are common to both SNMPv2c and SNMPv3.

#### NEW QUESTION # 49

Your customer has asked you to assign a switch management role for a new user. The customer requires the user role to view nonsensitive switch configuration information and only has the GET method for REST API for all resources other than \login and \logout.

Which default AOS-CX user role meets these requirements?

- A. administrators
- B. config
- C. sysadmin
- D. operators

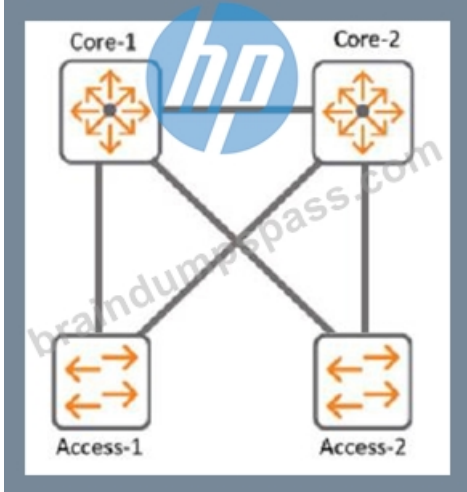

**Answer: D**

Explanation:

The default operators role in Aruba AOS-CX provides read-only access to the switch configuration and allows only GET requests (except for login/logout). This matches the requirement for viewing nonsensitive configuration information without the ability to make changes.

#### NEW QUESTION # 50

Refer to Exhibit:

With Access-1, What needs to be identically configured With MSTP to load-balance VLANS?

- A. Spanning-tree root-guard setting
- B. Spanning-tree instance vlan mapping
- C. Spanning-tree bpdu-guard setting
- D. spanning-tree Cist mapping

**Answer: B**

Explanation:

The correct answer is B. Spanning-tree instance VLAN mapping.

To load-balance VLANs with MSTP, you need to configure the same VLAN-to-instance mapping on all switches in the same MST region. This means that you need to assign different VLANs to different MST instances, and then adjust the spanning tree parameters (such as priority, cost, or port role) for each instance to achieve the desired load balancing. For example, you can make one switch the root for instance 1 and another switch the root for instance 2, and then map half of the VLANs to instance 1 and the

other half to instance 2.

According to the Cisco document Understand the Multiple Spanning Tree Protocol (802.1s), one of the steps to configure MST is: Split your set of VLANs into more instances and configure different MST settings for each of these instances. In order to easily achieve this, elect Bridge D1 to be the root for VLANs 501 through 1000, and Bridge D2 to be the root for VLANs 1 through 500. These statements are true for this configuration:

```
Switch D1(config)#spanning-tree mst configuration
```

```
Switch D1(config-mst)#instance 1 vlan 501-1000
```

```
Switch D1(config-mst)#exit
```

```
Switch D1(config)#spanning-tree mst 1 priority 0
```

```
Switch D2(config)#spanning-tree mst configuration
```

```
Switch D2(config-mst)#instance 2 vlan 1-500
```

```
Switch D2(config-mst)#exit
```

```
Switch D2(config)#spanning-tree mst 2 priority 0
```

The above commands create two MST instances, 1 and 2, and map VLANs 501-1000 to instance 1 and VLANs 1-500 to instance 2. Then, they make switch D1 the root for instance 1 and switch D2 the root for instance 2.

The other options are incorrect because:

A) Spanning-tree bpduguard setting is a security feature that disables a port if it receives a BPDU from an unauthorized device. It does not affect load balancing with MSTP.

C) Spanning-tree CIST mapping is not a valid command. CIST stands for Common and Internal Spanning Tree, which is the spanning tree instance that runs within an MST region and interacts with other regions or non-MST switches.

D) Spanning-tree root-guard setting is another security feature that prevents a port from becoming a root port if it receives superior BPDUs from another switch. It does not affect load balancing with MSTP.
