Axis Network Video Exam Sample Questions (Q117-Q122):

NEW QUESTION # 117

When decommissioning a device and removing it out of production, it is best practice to

- A. downgrade the firmware.
- B. perform a factory restore.
- C. perform a factory default.
- D. set the IP address back to the default.

Answer: C

Explanation:

"When decommissioning an Axis device, always perform a factory restore to securely remove all configuration, user data, and stored information from the device."

- Axis Decommissioning Guide

"A factory restore erases all user data and settings, returning the device to its original state, which is necessary before removing the device from service."

NEW QUESTION # 118

In good conditions, a pixel density of 250 px/m (80 px/ft) is required for

- A. observation.
- B. detection.
- C. recognition.
- **D. identification.**

Answer: D

Explanation:

In good conditions, a pixel density of 250 px/m (80 px/ft) is required for identification purposes. This means that at this resolution, the image quality is sufficient to identify individuals, objects, or other details accurately. Identification requires the highest level of detail among the common surveillance objectives (detection, observation, recognition, identification). This pixel density allows for clear and precise visual information necessary for identifying specific features such as facial characteristics or license plates.

NEW QUESTION # 119

If image clarity changes are made within the camera web interface, but are not reflected within a Video Management Software (VMS), what is the most likely cause of the camera not accepting the settings?

- A. The user does not have administrative rights to change the settings
- B. The camera is faulty and needs to be replaced
- **C. The VMS is overwriting the changes in the camera**
- D. The camera's advanced settings need to be changed first

Answer: C

Explanation:

When changes made to image clarity within the camera web interface are not reflected within a Video Management Software (VMS), it is often due to the VMS having its settings and configurations that can overwrite those made directly on the camera. Many VMS solutions are designed to manage and standardize settings across multiple cameras, ensuring consistency in video quality and performance. This functionality can override local changes made on the camera interface. According to Axis Network Video documentation, this behavior is typical in integrated systems where VMS settings take precedence to maintain uniformity across all connected devices.

NEW QUESTION # 120

The advantage of using multicast in the network is that

- **A. The video stream only needs to be sent once, even though there are multiple viewers.**
- B. Many cameras can share the same network connection.
- C. The video stream reaches every computer in the network simultaneously.
- D. The video stream is rerouted in case of network dropout.

Answer: A

Explanation:

Multicast is a method of data transmission in which a single stream of data is sent from a source to multiple destinations simultaneously. This technique is especially useful in video surveillance because it allows multiple viewers to receive the same video stream without duplicating the data sent across the network. In other words, the video stream only needs to be sent once from the camera, even though there are multiple viewers, reducing network bandwidth usage. This makes option C correct. For more detailed information, refer to Axis Communications' official documentation on network video fundamentals and multicast usage.

NEW QUESTION # 121

In setting up PTZ control for an Axis encoder, it's very easy to overlook a very important step in the configuration process. After properly connecting the communication wires to the encoder, the next recommended step in the setup is:

- A. Setting the Baud Rate to match the analog PTZ's
- B. Setting the Device ID to match the analog ID
- C. Uploading the correct PTZ driver
- D. Downloading the correct Device ID from the Axis website

Answer: C

NEW QUESTION # 122
