## How Good Is To Take ExamcollectionPass Confluent CCAAK Practice Test Material?

To attempt the Confluent CCAAK exam optimally and ace it on the first attempt, proper exam planning is crucial. Since the Confluent Certified Administrator for Apache Kafka (CCAAK) exam demands a lot of time and effort, we designed the Confluent Certified Administrator for Apache Kafka (CCAAK) exam dumps in such a way that you won't have to go through sleepless study nights or disturb your schedule. Before starting the Confluent Certified Administrator for Apache Kafka (CCAAK) preparation, plan the amount of time you will allot to each topic, determine the topics that demand more effort and prioritize the components that possess more weightage in the Confluent Certified Administrator for Apache Kafka (CCAAK) exam.

## Confluent Certified Administrator for Apache Kafka Sample Questions (Q51-Q56):

### NEW QUESTION # 51

Where are Apache Kafka Access Control Lists stored?"

- A. ZooKeeper
- B. Broker
- C. Schema Registry
- D. Connect

**Answer: A**

Explanation:

In Apache Kafka (open-source), Access Control Lists (ACLs) are stored in ZooKeeper. Kafka brokers retrieve and enforce ACLs from ZooKeeper at runtime.

### NEW QUESTION # 52

Multiple clients are sharing a Kafka cluster.

As an administrator, how would you ensure that Kafka resources are distributed fairly to all clients?

- A. Consumer Groups
- **B. Quotas**
- C. Rebalancing
- D. ACLs

**Answer: B**

Explanation:

Kafka quotas allow administrators to control and limit the rate of data production and consumption per client (producer/consumer), ensuring fair use of broker resources among multiple clients.

### NEW QUESTION # 53

How does Kafka guarantee message integrity after a message is written on a disk?

- **A. A message cannot be altered once it has been written.**
- **C A message can be grouped with message sharing the same key to improve read performance**
- B. A message can be edited by the producer, producing to the message offset.
- C. Only message metadata can be altered using command line (CLI) tools.

**Answer: A**

Explanation:

Kafka ensures message immutability for data integrity. Once a message is written to a Kafka topic and persisted to disk, it cannot be modified. This immutability guarantees that consumers always receive the original message content, which is critical for auditability, fault tolerance, and data reliability.

### NEW QUESTION # 54

A topic 'recurring payments' is created on a Kafka cluster with three brokers (broker id '0', '1', '2') and nine partitions. The 'min.insync replicas' is set to three, and producer is set with 'acks' as 'all'. Kafka Broker with id '0' is down.

Which statement is correct?

- A. Consumers can read committed messages from partitions on broker id T, "2\"
- **B. Producers and consumers will have no impact on six of the nine partitions.**
- C. Producers will only be able to write messages to the topic where the Leader for the partition is on Broker id T.
- D. Producers can write messages to all the partitions, because new leaders for the partitions will be elected.

**Answer: B**

Explanation:

With 9 partitions spread across 3 brokers, each broker typically hosts 3 leaders (assuming even distribution). When Broker 0 fails, the partitions for which it was leader will elect new leaders on brokers 1 or 2 if enough in-sync replicas (ISRs) remain. But since min.insync.replicas=3 and only 2 brokers are up, no partition can meet the minimum in-sync replica requirement, so producers with acks=all will fail to write. However, for partitions where Broker 0 is not the leader, consumers can still read committed messages. Given that only 3 partitions likely had Broker 0 as leader, six partitions remain accessible for reads, but not writes.

### NEW QUESTION # 55

You are managing a Kafka cluster with five brokers (broker id '0', '1','2','3','4') and three ZooKeepers. There are 100 topics, five partitions for each topic, and replication factor three on the cluster. Broker id '0' is currently the Controller, and this broker suddenly fails.

Which statements are correct? (Choose three.)

- A. The broker id is used as the epoch number to prevent a split brain scenario.

- B. The Controller uses the epoch number to prevent a split brain scenario.
- C. The Controller is responsible for reassigning partitions to the consumers in a Consumer Group.
- D. The number of Controllers should always be equal to the number of brokers alive in the cluster.
- E. Kafka uses ZooKeeper's ephemeral node feature to elect a controller.
- F. The Controller is responsible for electing Leaders among the partitions and replicas.

**Answer: B,E,F**

Explanation:

Kafka relies on ZooKeeper's ephemeral nodes to detect if a broker (controller) goes down and to elect a new controller.

The controller manages partition leadership assignments and handles leader election when a broker fails.

The epoch number ensures coordination and avoids outdated controllers acting on stale data.
