

DCA Exam Simulation: Docker Certified Associate (DCA) Exam & DCA Study Guide Materials

BTW, DOWNLOAD part of DumpStillValid DCA dumps from Cloud Storage: <https://drive.google.com/open?id=1sZdEs7XQ4jvNtMaM06Xnzcr7-54tlqVV>

Do you want to pass your Docker Certified Associate (DCA) Exam exam? If so, DumpStillValid is the ideal place to begin. DumpStillValid provides comprehensive DCA exam questions preparation in two simple formats: a pdf file format and an Docker DCA online practice test engine. If you fail your Docker Certified Associate (DCA) Exam (DCA) Exam, you can obtain a full refund and a 20% discount! Continue reading to discover more about the essential aspects of these excellent DCA exam questions.

Docker Certified Associate (DCA) exam is an excellent opportunity for IT professionals who want to advance their careers in Docker technology. Docker Certified Associate (DCA) Exam certification demonstrates the candidate's ability to create and manage Docker applications, which is highly valued by employers who use Docker technology. Furthermore, obtaining DCA certification can lead to higher salaries, better job opportunities, and increased job security. Whether you're a developer, system administrator, or IT manager, the DCA Certification can help you take your career to the next level.

Docker DCA certification is an industry-recognized credential that confirms a candidate's expertise in Docker containerization. Docker Certified Associate (DCA) Exam certification is widely accepted by organizations worldwide and is a valuable addition to a professional's resume. Docker DCA certified professionals are in high demand, and they can expect to receive higher salaries and better job opportunities.

Free PDF Quiz 2025 DCA: Trustable Dumps Docker Certified Associate (DCA) Exam PDF

We know deeply that a reliable DCA exam material is our company's foothold in this competitive market. High accuracy and high quality are the most important things we always looking for. Compared with the other products in the market, our DCA latest questions grasp of the core knowledge and key point of the real exam, the targeted and efficient Docker Certified Associate (DCA) Exam study training dumps guarantee our candidates to pass the test easily. Passing exam won't be a problem anymore as long as you are familiar with our DCA Exam Material (only about 20 to 30 hours practice). High accuracy and high quality are the reasons why you should choose us.

How much Docker Certified Associate Exam Cost

The price of the Docker Certified Associate Exam Cost is 195 USD.

Docker Certified Associate (DCA) Exam Sample Questions (Q29-Q34):

NEW QUESTION # 29

The Kubernetes yaml shown below describes a networkPolicy.

Will the networkPolicy BLOCK this traffic?

Solution: a request issued from a pod lacking the tier: api label, to a pod bearing the tier: backend label

- A. Yes
- B. No

Answer: A

Explanation:

Explanation

The networkPolicy shown in the image is designed to block traffic from pods lacking the tier: api label, to pods bearing the tier: backend label. This is because the policy is set to matchLabels: tier: backend, and the ingress is set to - from: podSelector: matchLabels: tier: api. Therefore, any traffic that does not match these labels will be blocked.

References:

- * Container security fundamentals part 2: Isolation & namespaces

I hope this helps you understand the concept of networkPolicy and how it works with Kubernetes. If you have any other questions related to Docker, please feel free to ask me.

NEW QUESTION # 30

You configure a local Docker engine to enforce content trust by setting the environment variable DOCKER_CONTENT_TRUST=1.

If myorg/myimage: 1.0 is unsigned, does Docker block this command?

Solution: docker image import <tarball> myorg/myimage:1.0

- A. Yes
- B. No

Answer: A

Explanation:

Explanation

Docker Content Trust (DCT) is a feature that allows users to verify the integrity and publisher of container images they pull or deploy from a registry server, signed on a Notary server¹. DCT is enabled by setting the environment variable DOCKER_CONTENT_TRUST=1 on the Docker client. When DCT is enabled, the Docker client will only pull, run, or build images that have valid signatures for a specific tag². However, DCT does not apply to the docker image import command, which allows users to import an image or a tarball with a repository and tag from a file or STDIN³. Therefore, if myorg/myimage:1.0 is unsigned, Docker will not block the docker image import <tarball>myorg/myimage:1.0 command, even if DCT is enabled. This is because the docker image import command does not interact with a registry or a Notary server, and thus does not perform any signature verification. However, this also means that the imported image will not have any trust data associated with it, and it will not be possible to push it to a registry with DCT enabled, unless it is signed with a valid key. References:

- * Content trust in Docker
- * Automation with content trust
- * [docker image import]
- * [Content trust and image tags]

NEW QUESTION # 31

Will this action upgrade Docker Engine CE to Docker Engine EE?

Solution: Uninstall 'docker-ce' package before installing 'docker-ee' package.

- A. No
- B. Yes

Answer: A

Explanation:

= Uninstalling the 'docker-ce' package before installing the 'docker-ee' package will not upgrade Docker Engine CE to Docker Engine EE. It will only remove the existing Docker Engine CE installation and install a new Docker Engine EE installation. This means that any existing containers, images, volumes, networks, and other Docker resources will be lost. To upgrade Docker Engine CE to Docker Engine EE without losing any data, you need to use the migration tool provided by Docker¹ or follow the steps described in the Docker documentation² or other online guides^{3,4}. Reference:

1: Migrate to Engine 1.10 | Docker Docs

2: Install Docker Engine | Docker Docs

3: Switching Docker 18.09 Community Edition to Enterprise Edition with no ...

4: How to upgrade Docker 18.09 Community Edition to Docker Enterprise 18.09

NEW QUESTION # 32

During development of an application meant to be orchestrated by Kubernetes, you want to mount the /data directory on your laptop into a container.

Will this strategy successfully accomplish this?

Solution: Create a PersistentVolume with storageclass: "" and hostPath: /data, and a persistentVolumeClaim requesting this PV. Then use that PVC to populate a volume in a pod

- A. No
- B. Yes

Answer: A

Explanation:

Explanation

= The strategy of creating a PersistentVolume with hostPath and a PersistentVolumeClaim to mount the /data directory on your laptop into a container will not work, because hostPath volumes are only suitable for single node testing or development. They are not portable across nodes and do not support dynamic provisioning. If you want to mount a local directory from your laptop into a Kubernetes pod, you need to use a different type of volume, such as NFS, hostPath CSI, or minikube. Alternatively, you can copy the files from your laptop to the container using kubectl cp command. References:

* Volumes | Kubernetes

* Configure a Pod to Use a PersistentVolume for Storage | Kubernetes

* Mount a local directory to kubernetes pod - Stack Overflow

* Kubernetes share a directory from your local system to kubernetes container - Stack Overflow

* How to Mount a Host Directory Into a Docker Container

NEW QUESTION # 33

Will this command mount the host's '/data' directory to the ubuntu container in read-only mode?

Solution: 'docker run --add-volume /data /mydata -read-only ubuntu'

- A. No
- B. Yes

Answer: A

Explanation:

Explanation

n: = Using the DTR web UI to make all tags in the repository immutable is not a good way to prevent an image, such as 'nginx:latest', from being overwritten by another user with push access to the repository. This is because making all tags immutable would prevent any updates to the images in the repository, which may not be desirable for some use cases. For example, if a user wants to push a new version of 'nginx:latest' with a security patch, they would not be able to do so if the tag is immutable. A better way to prevent an

image from being overwritten by another user is to use the DTR web UI to create a promotion policy that restricts who can push to a specific tag or repository¹. Alternatively, the user can also use the DTR API to create a webhook that triggers a custom action when an image is pushed to a repository². References:

- * Prevent tags from being overwritten | Docker Docs
- * Create webhooks | Docker Docs
