Passing DCA Score Feedback, DCA Latest Test Pdf

Free4Dump keeps an eye on changes in the Docker Docker Certified Associate (DCA) Exam exam syllabus and updates Docker DCA exam dumps accordingly to make sure they are relevant to the latest exam topics. After making the payment for Docker DCA dumps questions you'll be able to get free updates for up to 90 days. Another thing you will get from using the DCA Exam study material is free to support. If you encounter any problem while using the DCA prep material, you have nothing to worry about. The solution is closer to you than you can imagine, just contact the support team and continue enjoying your study with the Docker Certified Associate (DCA) Exam preparation material.

Docker Certified Associate (DCA) Exam Sample Questions (Q143-Q148):

NEW QUESTION # 143

One of several containers in a pod is marked as unhealthy after failing its livenessProbe many times. Is this the action taken by the orchestrator to fix the unhealthy container?

Solution: The controller managing the pod is autoscaled back to delete the unhealthy pod and alleviate load.

- A. Yes
- B. No

Answer: B

Explanation:

Explanation

= The livenessProbe is a mechanism that checks if the container is alive and healthy, and restarts it if it fails¹. The orchestrator is the component that manages the deployment and scaling of containers across a cluster of nodes². The action taken by the orchestrator to fix the unhealthy container is not to autoscale back and delete the pod, but to recreate the pod on the same or a different node³. This ensures that the desired number of replicas for the pod is maintained, and that the pod can resume its normal operation. Autoscaling back and deleting the pod would reduce the availability and performance of the service, and would not necessarily

alleviate the load.

References:

- * Configure Liveness, Readiness and Startup Probes | Kubernetes
- * What is a Container Orchestrator? | Docker
- * Pod Lifecycle | Kubernetes

I hope this helps you understand the concept of livenessProbe and orchestrator, and how they work with Docker and Kubernetes. If you have any other questions related to Docker, please feel free to ask me.

NEW QUESTION # 144

Is this a type of Linux kernel namespace that provides container isolation?

Solution. Host

- A. Yes
- **B. No**

Answer: B

Explanation:

= Host is not a type of Linux kernel namespace that provides container isolation. Linux namespaces are a feature of the Linux kernel that partitions kernel resources such that one set of processes sees one set of resources while another set of processes sees a different set of resources¹. There are eight kinds of namespaces available: Mount, Process, User, Network, UTS, IPC, Cgroup, and Time¹. Host is a parameter that can be used to run a container in the host's network namespace, which means the container shares the same network interfaces and configuration as the host². References:

- * Linux namespaces - Wikipedia
- * Network settings | Docker Documentation

NEW QUESTION # 145

When an application being managed by UCP fails, you would like a summary of all requests made to the UCP API in the hours leading up to the failure.

What must be configured correctly beforehand for this to be possible?

- **A. UCP audit logs must be set to the 'metadata' or 'request' level.**
- B. All engines in the cluster must have their log driver set to the 'metadata' or 'request' level.
- C. UCP logging levels must be set to the info' or debug' level.
- D. Set the logging level in the config object for the ucp-kube-epi-server container to warning or higher

Answer: A

NEW QUESTION # 146

In the context of a swarm mode cluster, does this describe a node?

Solution. an instance of the Docker CLI connected to the swarm

- A. Yes
- **B. No**

Answer: B

Explanation:

Explanation

An instance of the Docker CLI connected to the swarm does not describe a node in the context of a swarm mode cluster. A node is a physical or virtual machine that runs the Docker Engine and participates in the swarm. A node can have one of two roles: manager or worker. Manager nodes maintain the cluster state and orchestrate tasks. Worker nodes execute tasks assigned by manager nodes. An instance of the Docker CLI connected to the swarm is a client that can interact with the swarm using commands such as docker service, docker node, docker stack, etc. A client can connect to any manager node in the swarm using the --host or -H flag. References: <https://docs.docker.com/engine/swarm/key-concepts/#nodes-and-services>,

<https://docs.docker.com/engine/swarm/swarm-tutorial/#use-docker-for-mac-or-docker-for-windows>

NEW QUESTION # 147

Is this the purpose of Docker Content Trust?

Solution: Verify and encrypt Docker registry TLS.

- A. Yes
- **B. No**

Answer: B

Explanation:

Docker Content Trust (DCT) is a feature that allows users to verify the integrity and publisher of container images they pull or deploy from a registry server, signed on a Notary server¹². DCT does not verify or encrypt the Docker registry TLS, which is a separate mechanism for securing the communication between the Docker client and the registry server. The purpose of DCT is to ensure that the images are not tampered with or maliciously modified by anyone other than the original publisher³. References:

* Content trust in Docker | Docker Docs

* Docker Content Trust: What It Is and How It Secures Container Images
